

# Influence of frequency and saturation on AVO attributes in partially saturated rocks

Bastien Dupuy & Alexey Stovas

**NTNU – Trondheim**  
Norwegian University of  
Science and Technology

# Outline

- Introduction: why poroelasticity and AVO data ?
- Theories: wave propagation in porous media and patchy saturation
- Method to extract AVO attributes
- Results: influence of frequency and saturation

# Poroelastodynamic equations

$$\left\{ \begin{array}{l} \nabla \cdot \boldsymbol{\tau} = -\omega^2 (\rho \vec{u} + \rho_f \vec{w}) \quad \text{Equations of motion} \\ \boldsymbol{\tau} = [K_U \nabla \cdot \vec{u} + C \nabla \cdot \vec{w}] \mathbf{I} + G [\nabla \vec{u} + (\nabla \vec{u})^t - 2/3 \nabla \cdot \vec{u} \mathbf{I}] \\ -P = C \nabla \cdot \vec{u} + M \nabla \cdot \vec{w} \quad \text{Mechanical behaviour laws} \\ -\nabla P = -\omega^2 (\rho_f \vec{u} + \tilde{\rho} \vec{w}) \quad \text{Equations of motion} \end{array} \right.$$

Elastic fields  
Poroelastic fields

8 unknowns in 2D :

- Solid  $u_x$  and  $u_z$  and relative fluid/solid  $w_x$  and  $w_z$  displacements
- Stresses  $\tau_{xx}$ ,  $\tau_{zz}$ ,  $\tau_{xz}$  and fluid pressure  $P$

7 parameters :

- *Inertial terms:*  $\rho$ ,  $\rho_f$  and  $\tilde{\rho}$
- *Mechanical moduli:*  $K_U$ ,  $G$ ,  $C$  and  $M$

# Poroelastodynamic equations

$$\left\{ \begin{array}{l} \nabla \cdot \boldsymbol{\tau} = -\omega^2 (\rho \vec{u} + \rho_f \vec{w}) \\ \boldsymbol{\tau} = [K_U \nabla \cdot \vec{u} + C \nabla \cdot \vec{w}] \mathbf{I} + G [\nabla \vec{u} + (\nabla \vec{u})^t - 2/3 \nabla \cdot \vec{u} \mathbf{I}] \\ -P = C \nabla \cdot \vec{u} + M \nabla \cdot \vec{w} \\ -\nabla P = -\omega^2 (\rho_f \vec{u} + \tilde{\rho} \vec{w}) \end{array} \right. \leftarrow \text{Simple upscaling}$$

Frequency dependence:  $\omega$

– *Simple upscaling:*  $\tilde{\rho}(\omega) \rightarrow$  flow resistance term

# Poroelastodynamic equations

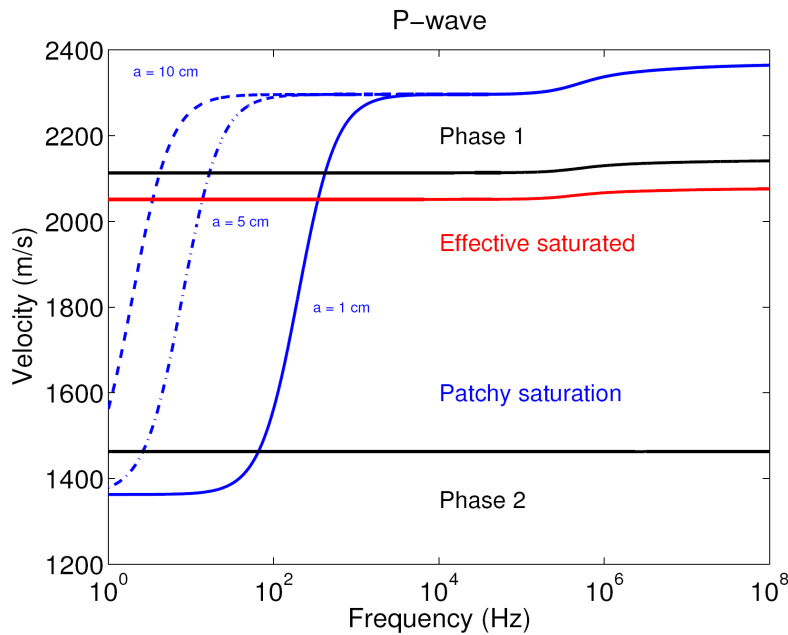

$$\left\{ \begin{array}{l} \nabla \cdot \boldsymbol{\tau} = -\omega^2 (\rho \vec{u} + \rho_f \vec{w}) \\ \boldsymbol{\tau} = [K_U \nabla \cdot \vec{u} + C \nabla \cdot \vec{w}] \mathbf{I} + G [\nabla \vec{u} + (\nabla \vec{u})^t - 2/3 \nabla \cdot \vec{u} \mathbf{I}] \\ -P = C \nabla \cdot \vec{u} + M \nabla \cdot \vec{w} \\ -\nabla P = -\omega^2 (\rho_f \vec{u} + \tilde{\rho} \vec{w}) \end{array} \right.$$

Complex upscalings  
Simple upscaling

Frequency dependence:  $\omega$

- *Simple upscaling:*  $\tilde{\rho}(\omega) \rightarrow$  flow resistance term
- *Complex upscalings:*  $\tilde{\rho}(\omega)$   
 $K_U(\omega)$ ,  $G(\omega)$ ,  $C(\omega)$  and  $M(\omega) \rightarrow$  mechanic moduli

# Partial saturation: effective attributes

P-waves velocities

P-waves attenuations

-    Patchy saturation results with various patches sizes  $a$

Seismogram with injection

# Two-steps inversion

Porosity, solid and fluid parameters....

## MICRO-SCALE PARAMETERS

Between 10 and 18 parameters

## DOWNSCALING

Grid search: Monte-Carlo, NA, GA, SA...

## MACRO-SCALE ATTRIBUTES

- Propagation velocities:  $V_p$ ,  $V_s$
- Attenuations :  $Q_p$ ,  $Q_s$
- AVO attributes
- Phase velocities

Inverse problem

## Two-steps inversion:

- seismic imaging: local optimization
- downscaling: semi-global optimization

Seismogram with injection

## MACRO-SCALE DATA

- Arrival times
- Attenuations
- Full waveforms
- Polarization
- Surface waves dispersion

## SEISMIC IMAGING

- Arrival times tomography
- FWI
- AVO analysis
- MASW

# Skeleton and saturation parameters downscaling (unsaturated medium)

Fit:  
 $\phi = 34 \%$   
 $CS = 22 \%$   
 $S_w = 70 \%$

✗ True model

$V_P, V_S$

A priori known parameters:

- Fluid phases:  $K_f, \rho_f, \eta$
- Solid phase:  $K_s, G_s, \rho_s$

Fit:  
 $\phi = 0.14 \%$   
 $CS = 0.6 \%$   
 $S_w = 0.5 \%$

$V_P, Q_P, \rho$

# Skeleton and saturation parameters downscaling (unsaturated medium)

➔ Need of amplitude data to estimate saturation => AVO data

# 3D three layers model

Explosive source  
Source function = Ricker wavelet  
Central frequency = 10 to 60 Hz

# AVO curves for PP and PS events

PP event

Vertical displacement  $u_z$

Source: 40 Hz

High water saturation: 90 and 80 %

Low water saturation: 10 and 20 %

PS event

Horizontal displacement  $u_x$

Low water saturation: 20 %

Several source frequencies:

10, 20, 30, 40, 50 and 60 Hz

# AVO curves for PP and PS events

PP event

Vertical displacement  $u_z$

Source: 40 Hz

High water saturation: 90 and 80 %

Low water saturation: 10 and 20 %

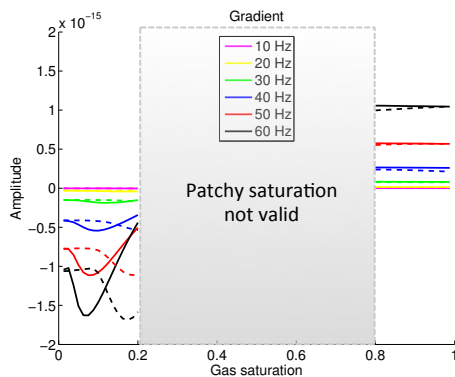

PS event

Horizontal displacement  $u_x$

Low water saturation: 20 %

Several source frequencies:

10, 20, 30, 40, 50 and 60 Hz

Low gas saturation

High gas saturation

PP event, vertical displacement  $u_z$

$$A_{PP}(\theta) = R_0 + G \sin^2(\theta) + K \sin^4(\theta)$$

Low gas saturation

High gas saturation

PP event, horizontal displacement  $u_x$

$$A_{PP}(\theta) = R_0 + G \sin^2(\theta) + K \sin^4(\theta)$$

Intercept B

Gradient C

Low gas saturation

High gas saturation

PS event, vertical displacement  $u_z$

$$A_{PS}(\theta) = B \sin(\theta) + C \sin^3(\theta)$$

Intercept B

Gradient C

Low gas saturation

High gas saturation

PS event, horizontal displacement  $u_x$

$$A_{PS}(\theta) = B \sin(\theta) + C \sin^3(\theta)$$

# Conclusions

- Strong frequency dependence of AVO attributes, especially at high frequency
  - For high and low fluid saturation scenarios, the effect of saturation on the attributes is minor (except at high frequency)
  - Different behaviors between horizontal  $u_x$  and vertical  $u_z$  results
  - Strong differences between patchy saturation and averages results, mainly for PP results.
- ➔ The AVO analysis can give us some extra-information on wave amplitudes
- Road ahead:
    - Real data examples
    - Inversion approach using AVO attributes
    - 4D applications

# Least-square fitting

$$A_{PP}(\theta) = R_0 + G \sin^2(\theta) + K \sin^4(\theta)$$

Vertical displacement  $u_z$

Horizontal displacement  $u_x$

PP event

Source: 40 Hz

High water saturation:

98.75, 95, 91.25, 87.5, 83.75 and 80 %

# Extraction of AVO information

## Method:

1. Computation of full waveform seismograms in 3D stratified three layers medium,
2. Extraction of maximum amplitude for each event (PP and PS) using a time windowing,
3. Computation of AVA curves (amplitude A with respect to the incidence angle  $\theta$ ),
4. Least-square fitting of these curves with polynoms to compute the attributes as

$$A_{PP}(\theta) = R_0 + G \sin^2(\theta) + K \sin^4(\theta)$$

$$A_{PS}(\theta) = B \sin(\theta) + C \sin^3(\theta)$$

where  $R_0$  and  $B$  are the intercept,  $G$  and  $C$  are the gradient and  $K$  is the curvature.

5. Plot of each attributes with respect to the frequency and the saturation

# Seismic imaging: poroelastic FWI

3D acoustic FWI (*Sirgue et al, 2010*) →  
**high resolution images**

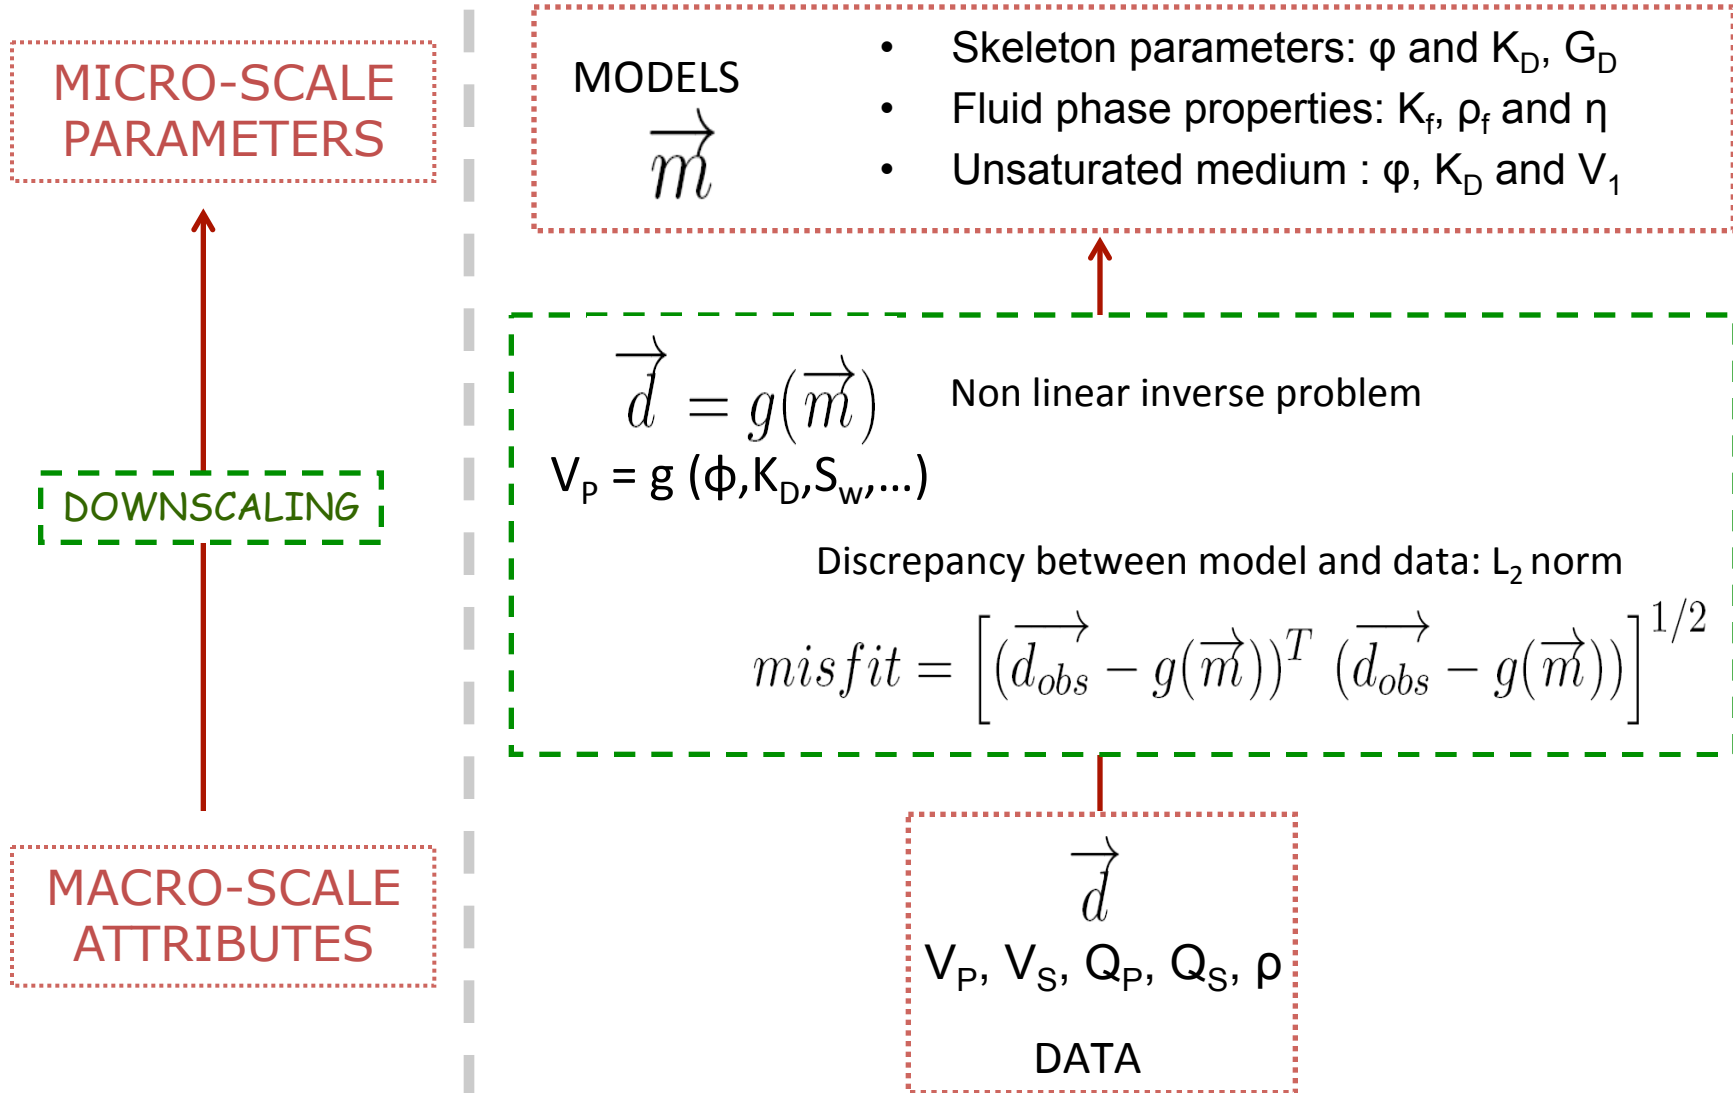

2D elastic FWI (*Brossier et al, 2009*) →  $V_p$  and  $V_s$   
**high resolution 2D images**

Poroelastic FWI (*De Barros et al, 2010*) →  
**differential approach**

# Downscaling

# Semi-global optimization

Fast and analytic forward  
problem

Neighbourhood algorithm (NA,  
*Sambridge, 1999*):

- Only 2 control parameters
- Model space guided exploration
- Fit quality and uncertainty

Number of generated models:

- a) 10
- b) 100
- c) 1000
- d) Fit map

# Skeleton parameters sensitivity (saturated medium)

A priori known parameters:

- Fluid phase:  $K_f$ ,  $\rho_f$ ,  $\eta$
- Solid phase:  $K_s$ ,  $G_s$ ,  $\rho_s$

✗ True model

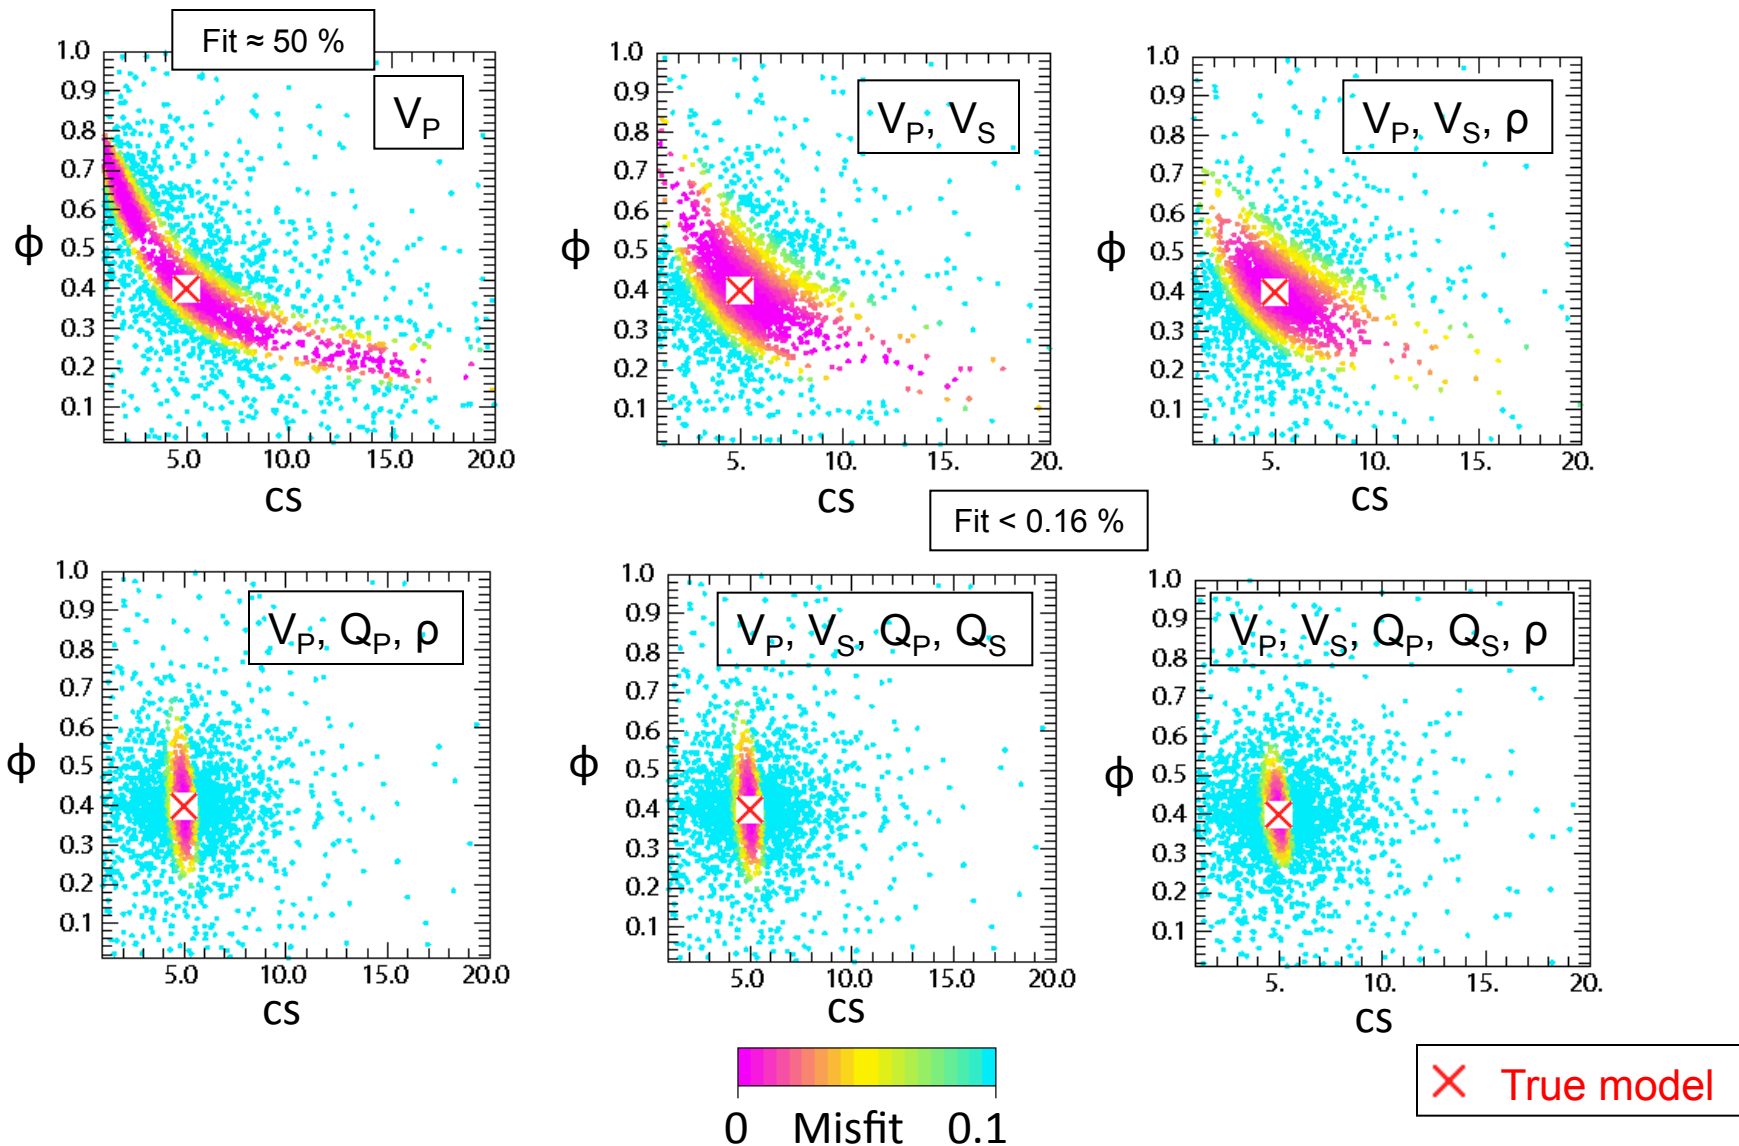

Data:  $V_p$

Fit between true model – estimated model  $\approx 50\%$

→ Local minima, low constraining

# Skeleton parameters: additional data input

→ Best constraining  $\phi$  and  $cs$  estimation when we use more data

# Downscaling after injection

$V_p$  estimated by acoustic differential FWI  
(Asnaashari, 2011)

Fluid phase estimated by downscaling
