Aspect ratio histograms of 3D Ellipsoids and 2D Ellipses*

* Paper submitted to Geophysics

M. Landrø

3D ellipsoids might represent...

• Pore

- Crack
- Grain

Cutting an ellipsoid with a plane

$$\frac{x_1^2}{a^2} + \frac{x_2^2}{b^2} + \frac{x_3^2}{c^2} = 1 \qquad n = (n_1, n_2, n_3)^T$$

Kiein (2012) shows that the cut is an ellipse with half axes
$$A = \sqrt{\frac{1-d}{\beta_1}} \qquad B = \sqrt{\frac{1-d}{\beta_2}} \qquad \Longrightarrow \qquad \alpha' = \sqrt{\frac{\beta_2}{\beta_1}} \text{ 2D aspect ratio}$$

$$\beta^2 - \left[n_1^2 \left(\frac{1}{b^2} + \frac{1}{c^2}\right) + n_2^2 \left(\frac{1}{a^2} + \frac{1}{c^2}\right) + n_3^2 \left(\frac{1}{a^2} + \frac{1}{b^2}\right)\right] \beta + \frac{n_1^2}{b^2c^2} + \frac{n_2^2}{a^2c^2} + \frac{n_3^2}{a^2b^2} = 0$$

ecial case 1: two shortest semiaxes, a =b < c = $\mathcal{O} = c \, / \, a$ 3D aspect ratio

$$\alpha' = \frac{\alpha}{\sqrt{1 + n_3^2(\alpha^2 - 1)}}$$

Simple relation between 2D and 3D aspect ratio

The histogram of the 2D aspect ratio

$$\alpha' = \frac{\alpha}{\sqrt{1 + n_3^2(\alpha^2 - 1)}}$$

Histogram given by **the derivative** of n₃ with respect to the 2D aspect ratio: $h(\alpha') \propto \frac{dn_3}{d\alpha'} = \frac{const \cdot \alpha^2}{\alpha'^2 \sqrt{(\alpha^2 - 1)(\alpha^2 - \alpha'^2)}}$

$$h(\alpha') = \frac{N\alpha^2}{\alpha'^2 \sqrt{(\alpha^2 - 1)(\alpha^2 - \alpha'^2)}} \qquad N = \text{number of realization}$$

Note: *h* is independent of n_3 -distribution

The 3D to 2D transform:

$$h_{2D}(\alpha') = \int h_{3D}(\alpha) K(\alpha, \alpha') d\alpha$$

$$K(\alpha, \alpha') = \frac{\alpha^2}{\alpha'^2 \sqrt{(\alpha^2 - 1 + \varepsilon)(\alpha^2 - \alpha'^2 + \varepsilon)}}$$

The 2D to 3D transform: $h_{3D}(\alpha) = \int h_{2D}(\alpha') K^{-1}(\alpha', \alpha) d\alpha'$ $K^{-1}(\alpha', \alpha) = \frac{\alpha(\alpha'^2 - 1)}{\alpha'(\alpha^2 - 1 + \varepsilon)^{\frac{3}{2}} \sqrt{(\alpha^2 - \alpha'^2 + \varepsilon)}}$

Uniform distribution - 10 000 realization

$$\alpha = \alpha_{3D} = 4$$

$$\alpha = \alpha_{2D}$$

Non-uniform example

Normal distribution: $\langle n_1 \rangle = \langle n_2 \rangle = \langle n_3 \rangle = 0.47$ $\sigma = 0.33$

Decreasing the standard deviation yields a worse fit $h(\alpha') = \frac{N\alpha^2}{\alpha'^2 \sqrt{(\alpha^2 - 1)(\alpha^2 - \alpha'^2)}}$

Note: This formula is general, not dependent on the assumed distribution -independent of n_3

Rudge et al., 2008:

Rudge et al., 2008 use spherocylinders and use a random close packing – followed by one single 2D cut.

I computed the 2D aspect ratio from this figure and compared to my results =>

Comparison with Rudge et al., 2008

Rudge et al., 2008 use spherocylinders and use a random close packing – followed by one single 2D cut

A normal distribution of 3D aspect ratio -forward modeling of 2D aspect

Testing the 2D to 3D transform

ar, a=b; what if a , b and c are different?

Shorter axes apsect ratios easier to detect

An attempt to find an equation for the general case (a=1, b and c different) $h(\alpha') \propto \frac{dn_1}{d\alpha'} = \frac{const \cdot \alpha'}{b\sqrt{b^2 - 1 - \alpha'^2 + \varepsilon_{bc}b^4}}$ $\varepsilon_{bc} = \frac{1}{3} \left(\frac{1}{b^2} - \frac{1}{c^2} \right)$

Note: Approximate equation - far from exact!

The importance of 3D selection of cuts to reveal the aspect ratio

$$\langle n_3^2 \rangle = \sigma^2 + \mu^2 = 0.09^2 + 0.57^2 = 0.33$$

$$\alpha' = \frac{\alpha}{\sqrt{1+n_3^2(\alpha^2-1)}}$$

$$\alpha' = 4/\sqrt{1+0.33 \cdot 15} = 1.63$$

The true value of 4 is not observed on the 2D histogram, but the «wrong» value of 1.6

Coupling aspect ratio (3D) to rock physics

$$\frac{1}{K_{\phi}} = \frac{4(c/a)(1-v^2)}{3\pi K_0(1-2v)} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)} \begin{bmatrix} 4\alpha(1-v^2) \\ 3\pi K_0(1-2v) \end{bmatrix} = \frac{4\alpha(1-v^2)}{3\pi K_0(1-2v)$$

Penny-shaped pore: c >> a=b

Mavko et al., 2009

Poisson ratio (solid mineral)

KBulk modulus (solid mineral) α **3D aspect ratio**

Ks the pore stiffness

Another application: Anisotropy

Discussion and conclusions

- Simple equation to derive 2D aspect ratio histograms from 3D ellipsoids is derived
- 2D to 3D transform of aspect ratio is derived and tested by stochastic simulations
- Using thin sections to estimate 3D aspect ratio might be misleading
- Useful for rock physics applications?
