Reflection waveform tomography

In seismic waveform tomography, if using reflection data with limited source-receiver offsets, it is difficult to reconstruct the deep part of the subsurface velocity model.

Weighted Updating Scheme

By definition, tomography is an integral along the ray path; that is, data residuals are spread evenly along the ray path.

The residual projected to a cell is then linearly related to the model update of the cell, and thus the model update depends upon the total length of ray segments within the cell, i.e. the ray density.

Weighted Updating Scheme

Since the ray density in the shallow depth is much higher than that in deeper parts of the model, the model update in the shallow depth is much higher than that in the deep portion of the model.

This is a underlying rationale for using depth-dependent weights in model updating.

Weighted Updating Scheme

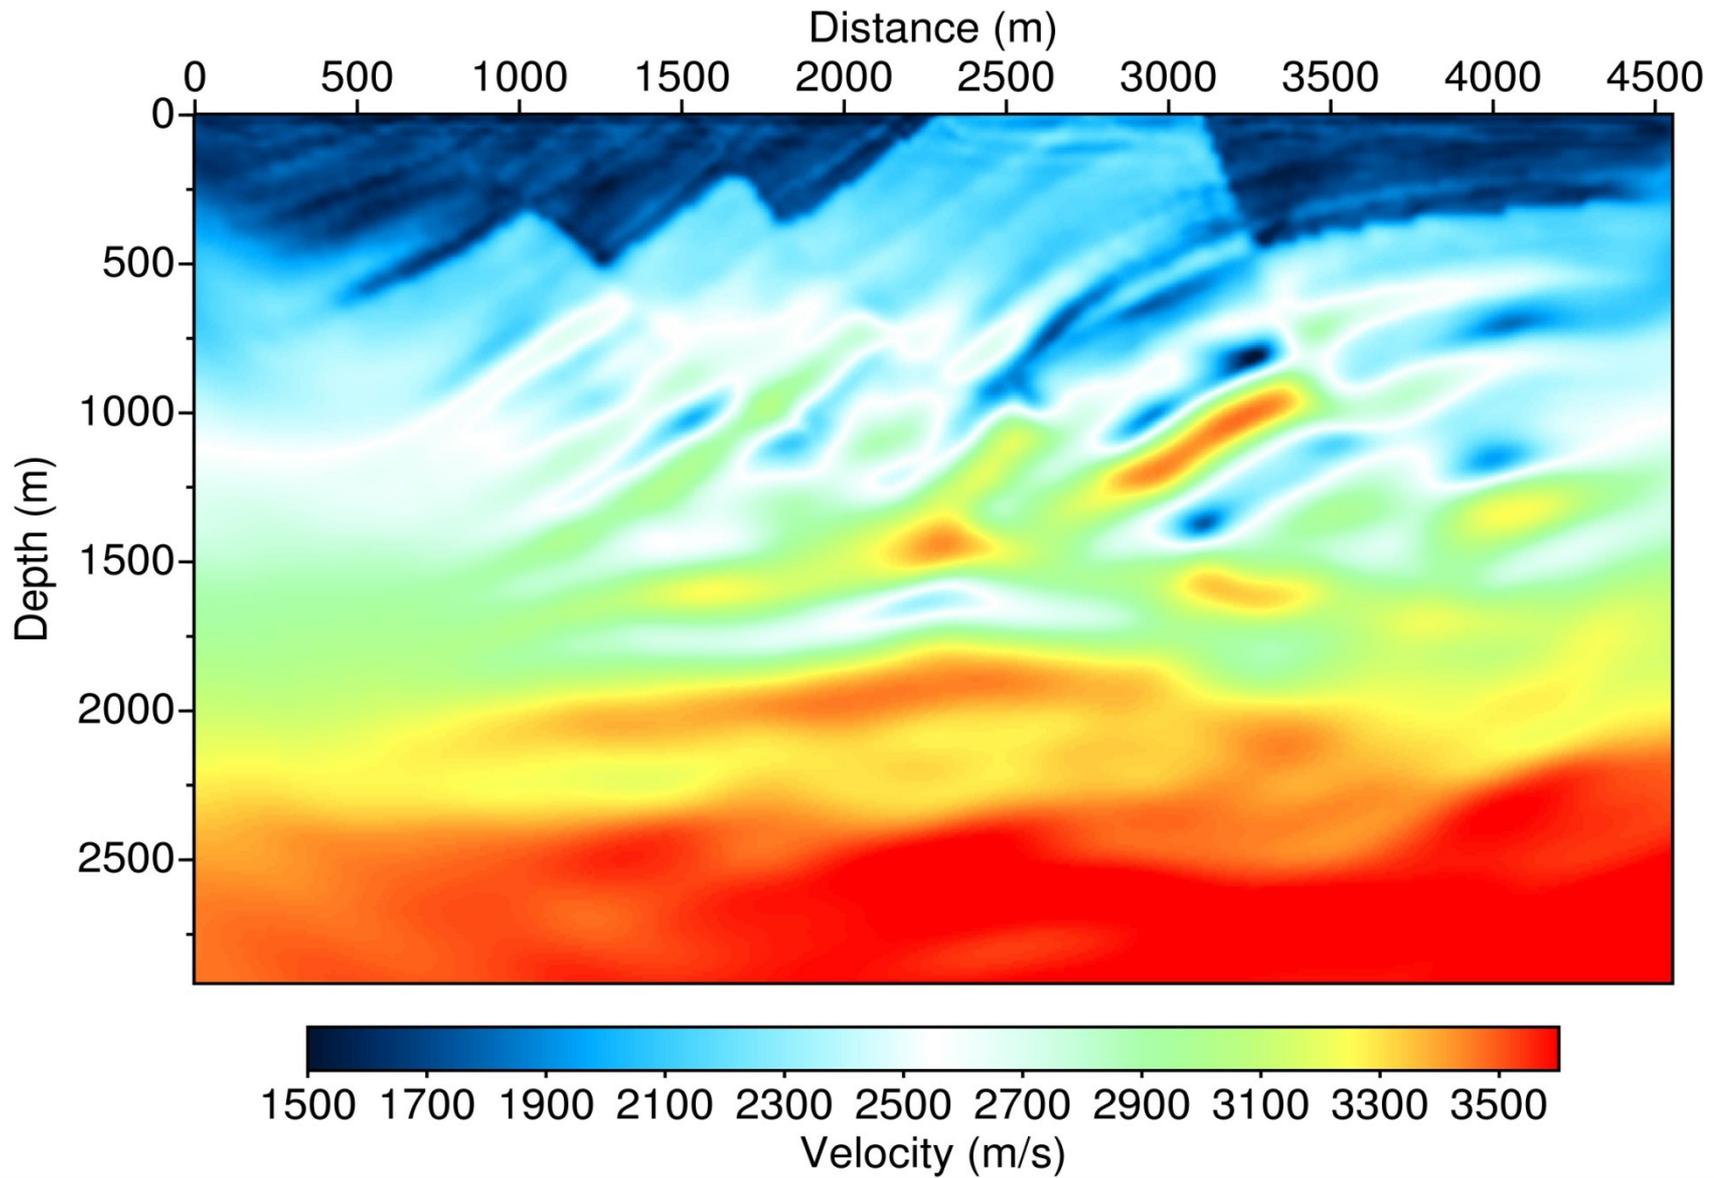

$$\mathbf{m}^{(\ell+1)} = \mathbf{m}^{(\ell)} - \alpha \boldsymbol{\gamma}$$

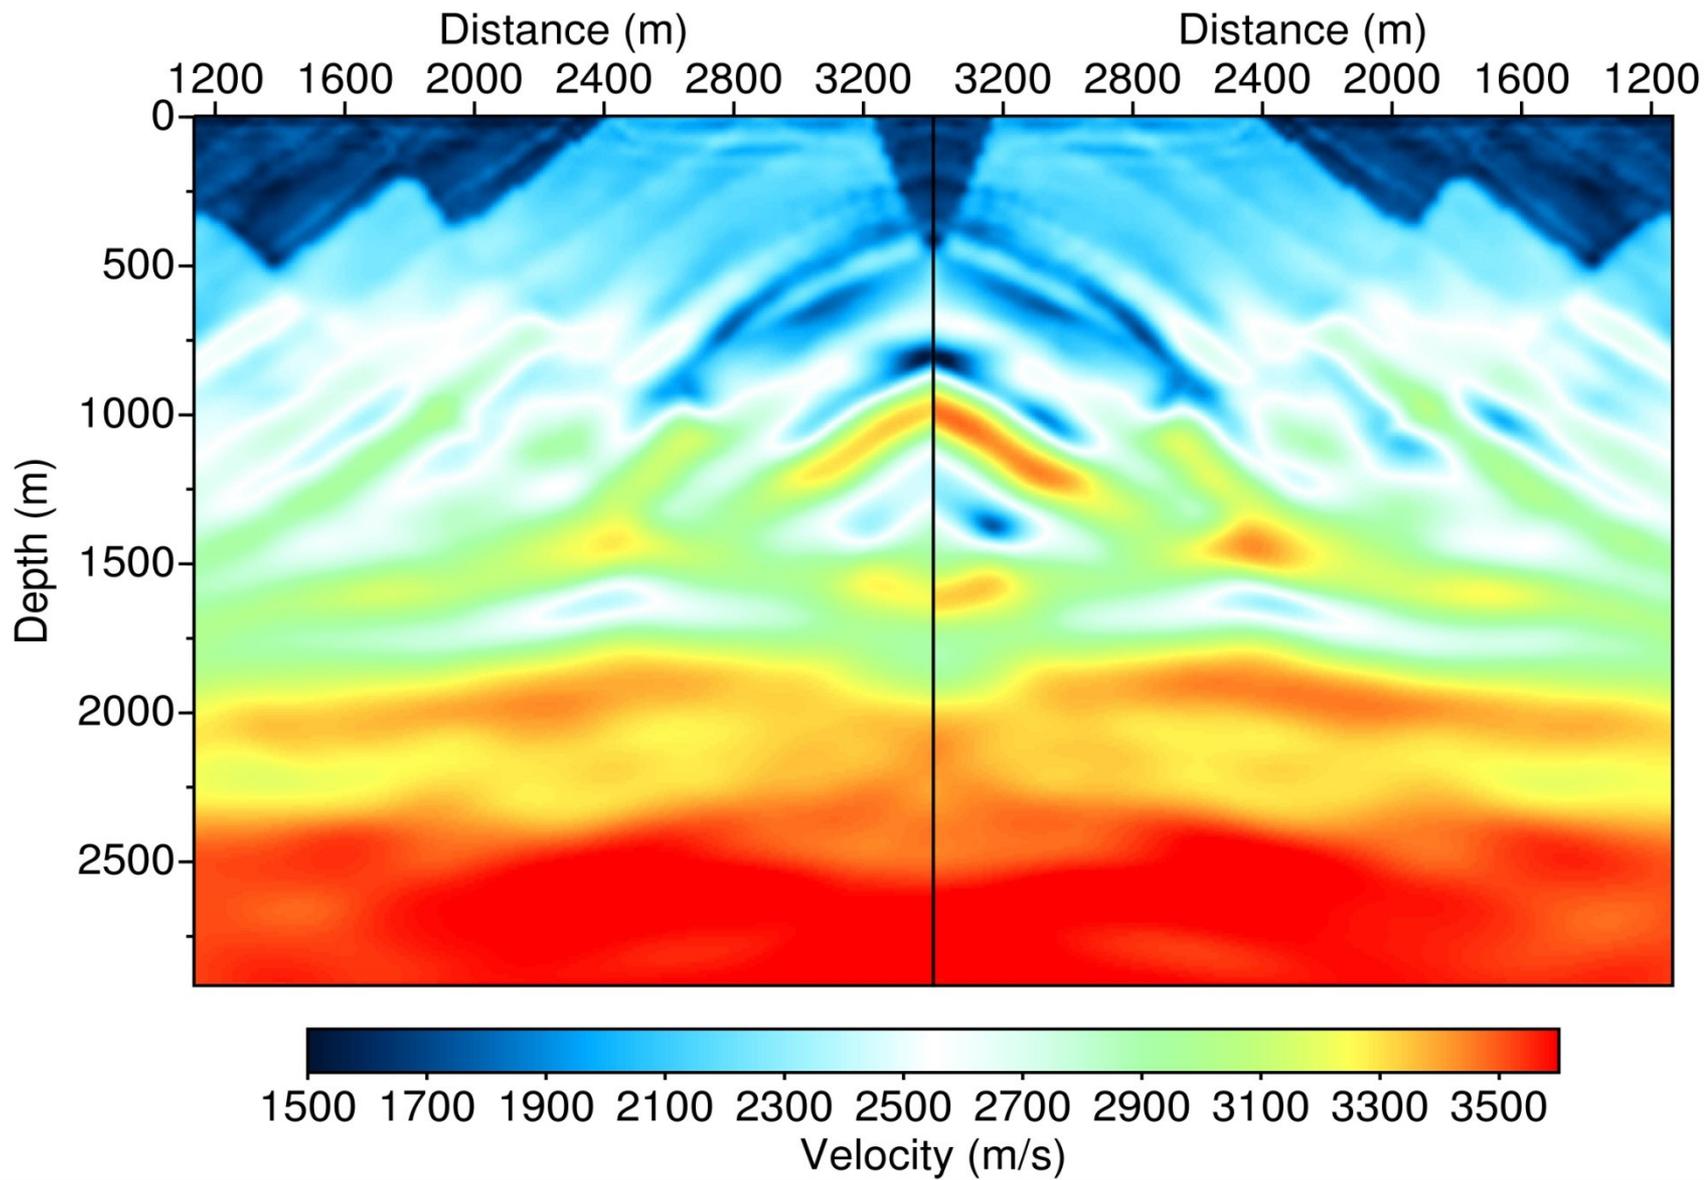

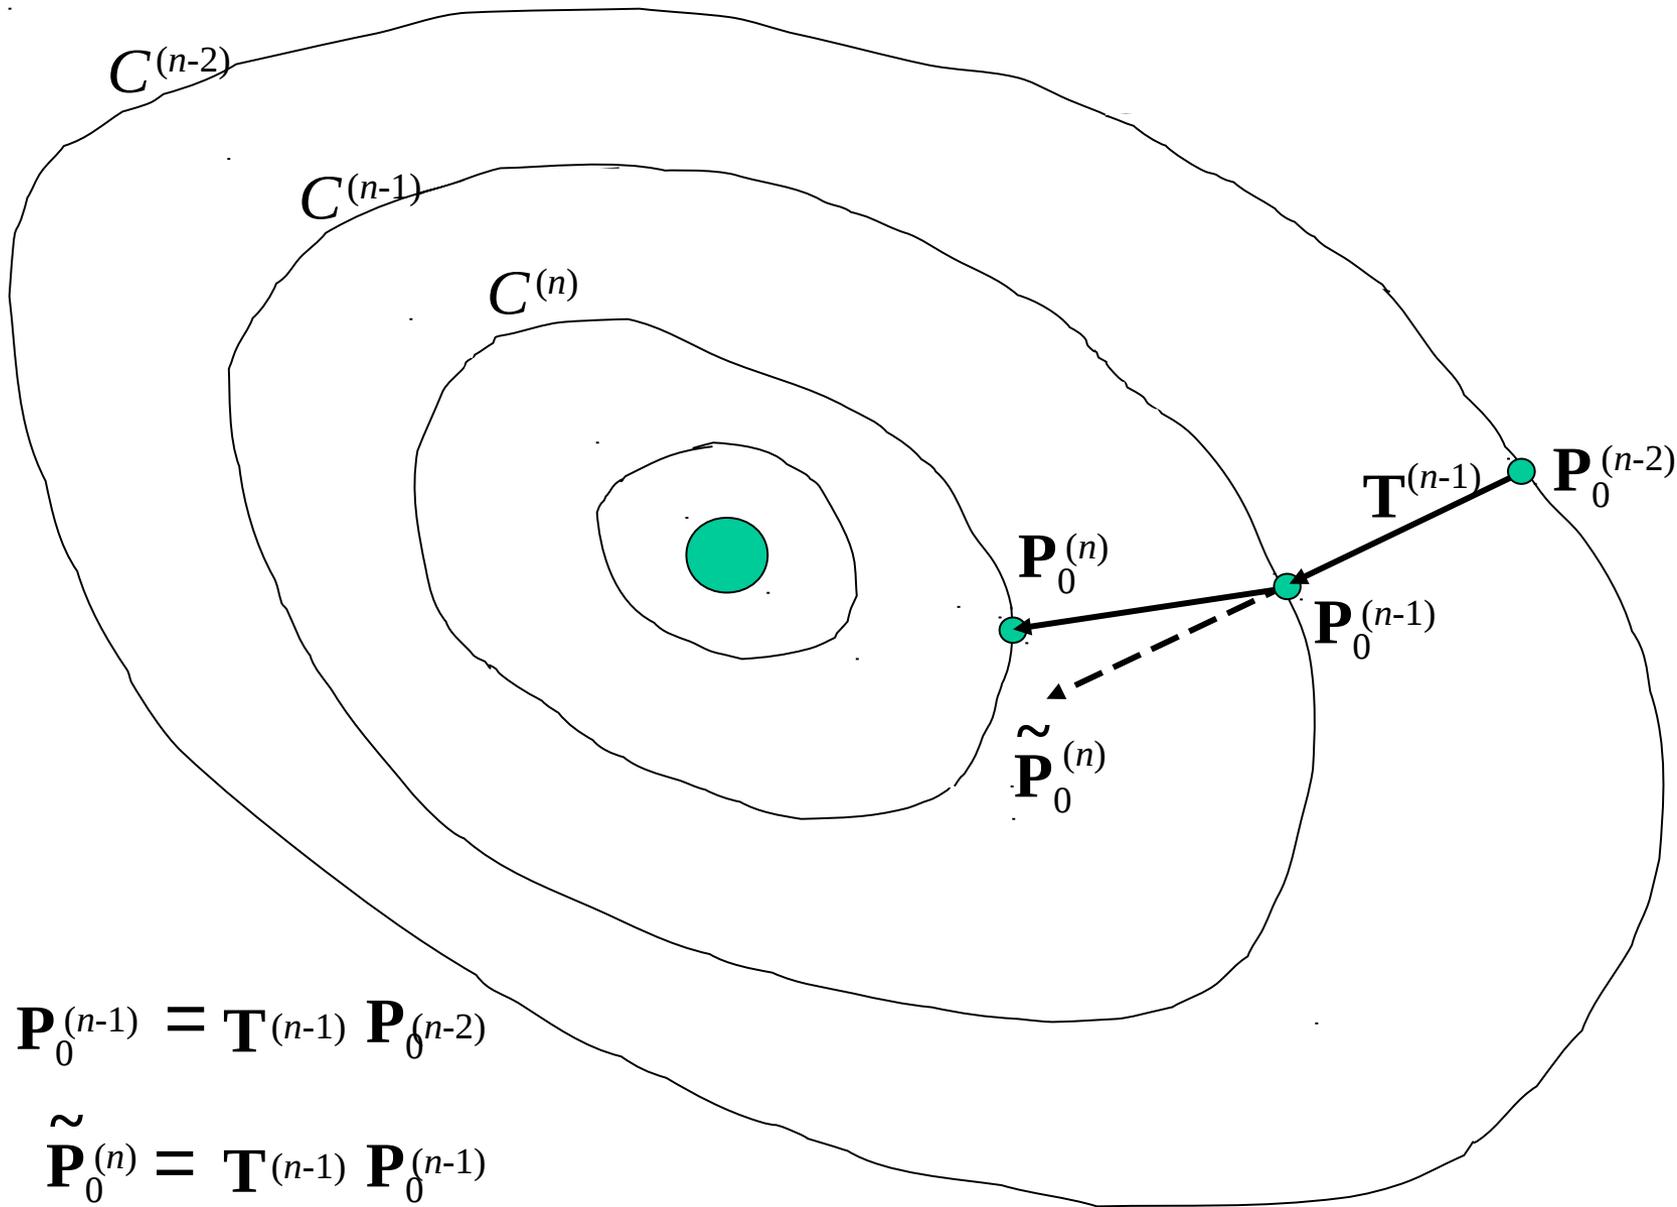

$$\mathbf{m}^{(\ell+1)} = \mathbf{m}^{(\ell)} - \alpha \mathbf{H}^{-1} \boldsymbol{\gamma}$$

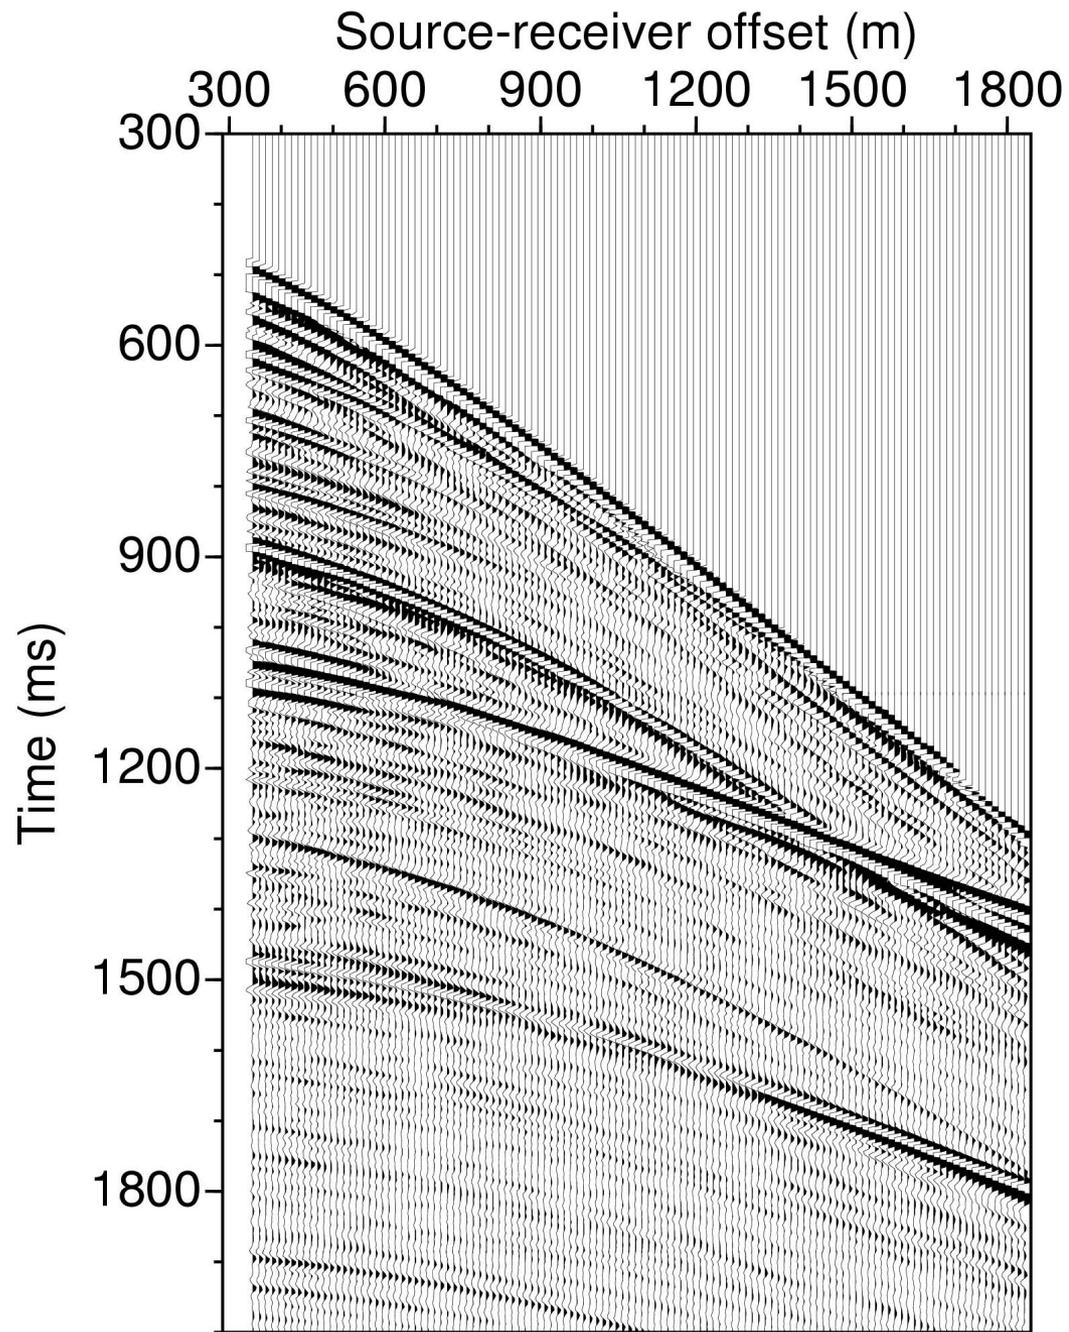

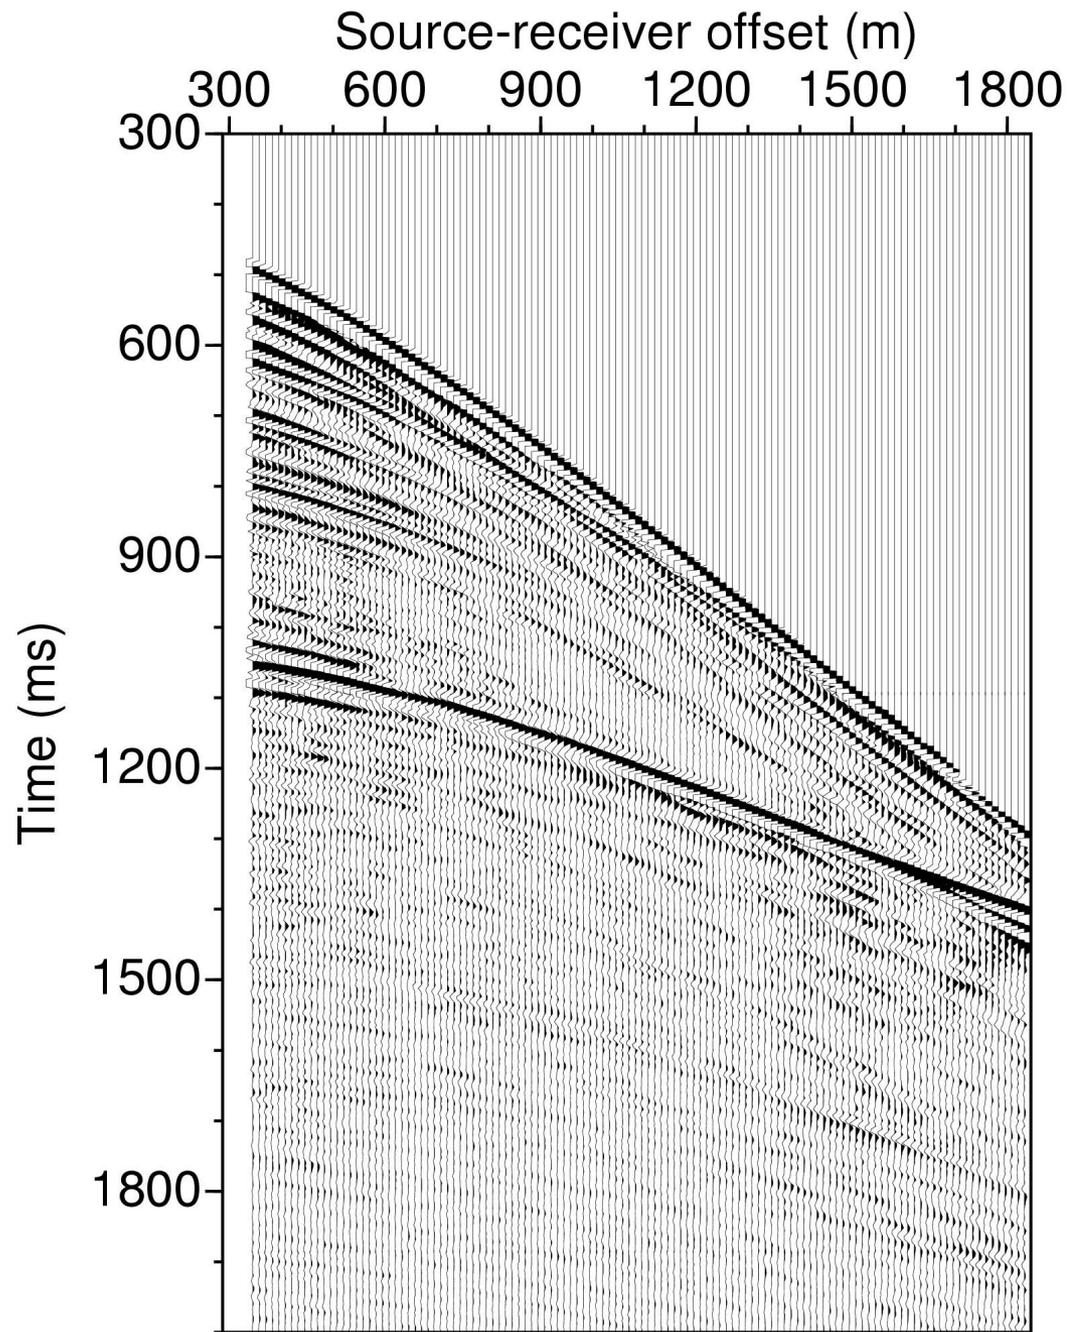

$$\mathbf{m}^{(\ell+1)} = \mathbf{m}^{(\ell)} - \alpha \beta(z) \boldsymbol{\gamma}$$

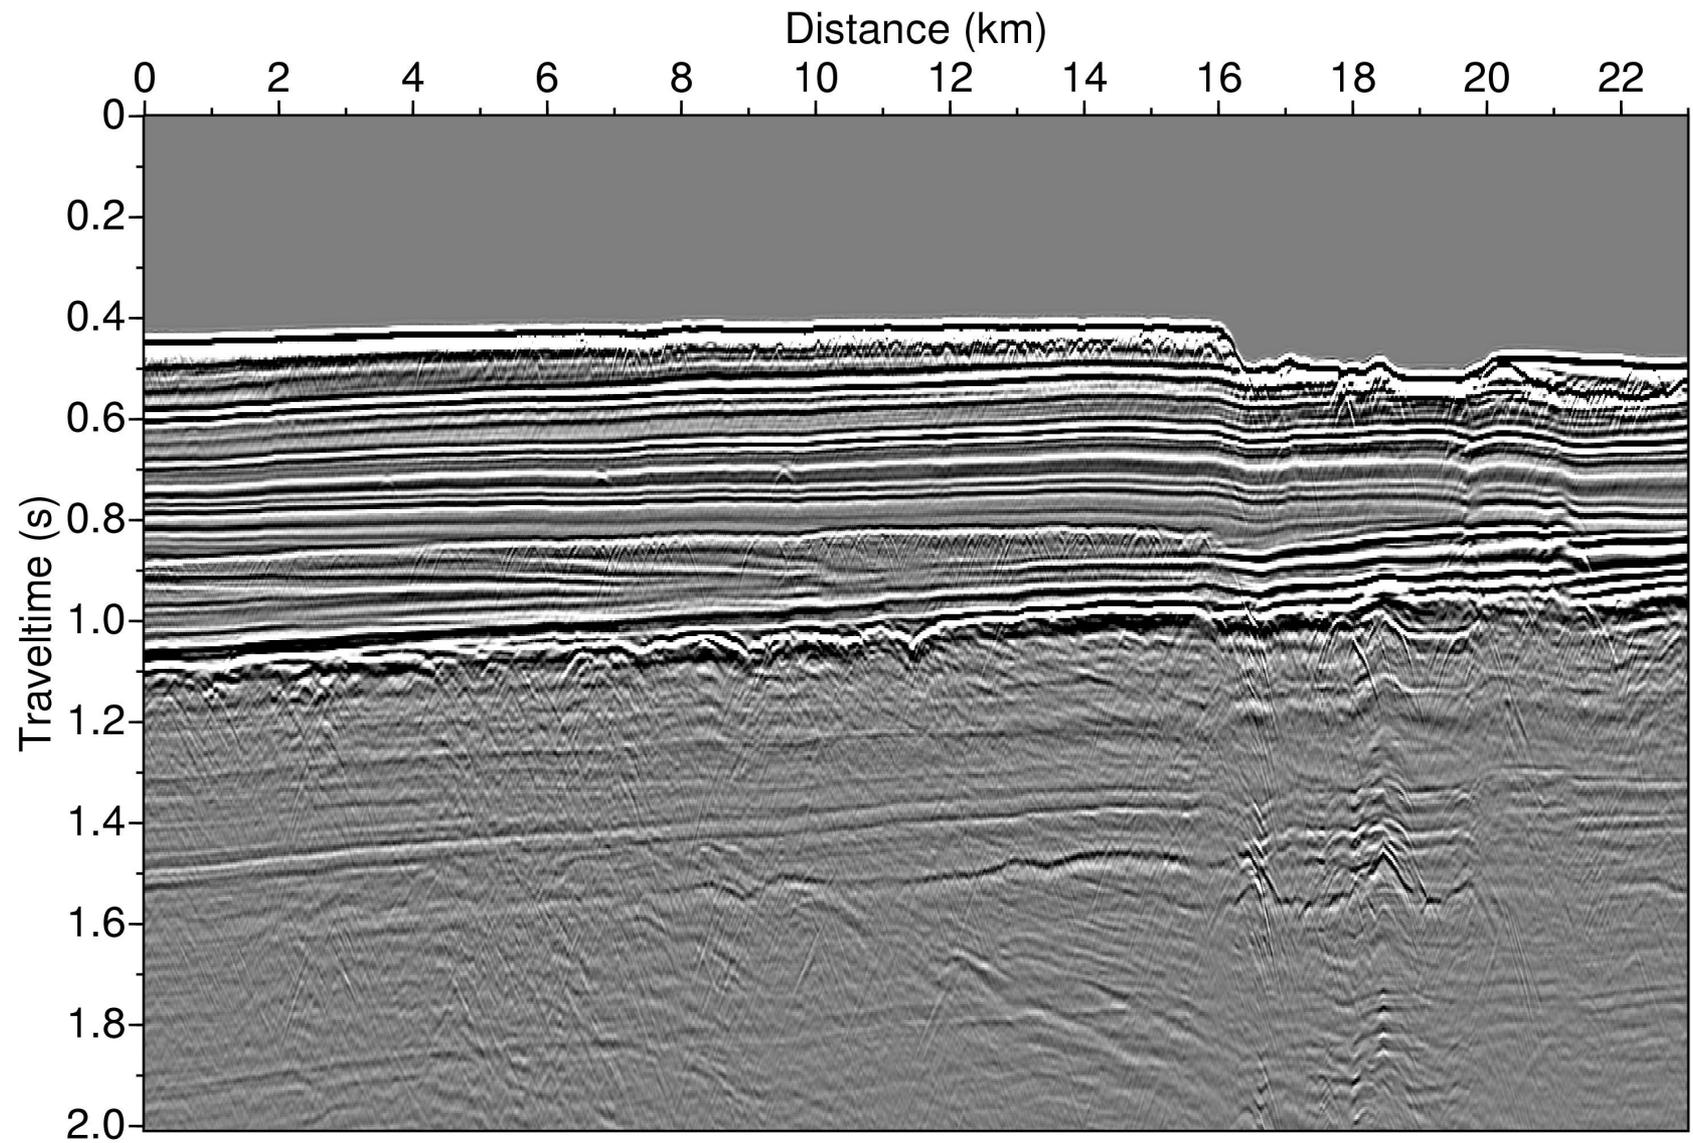

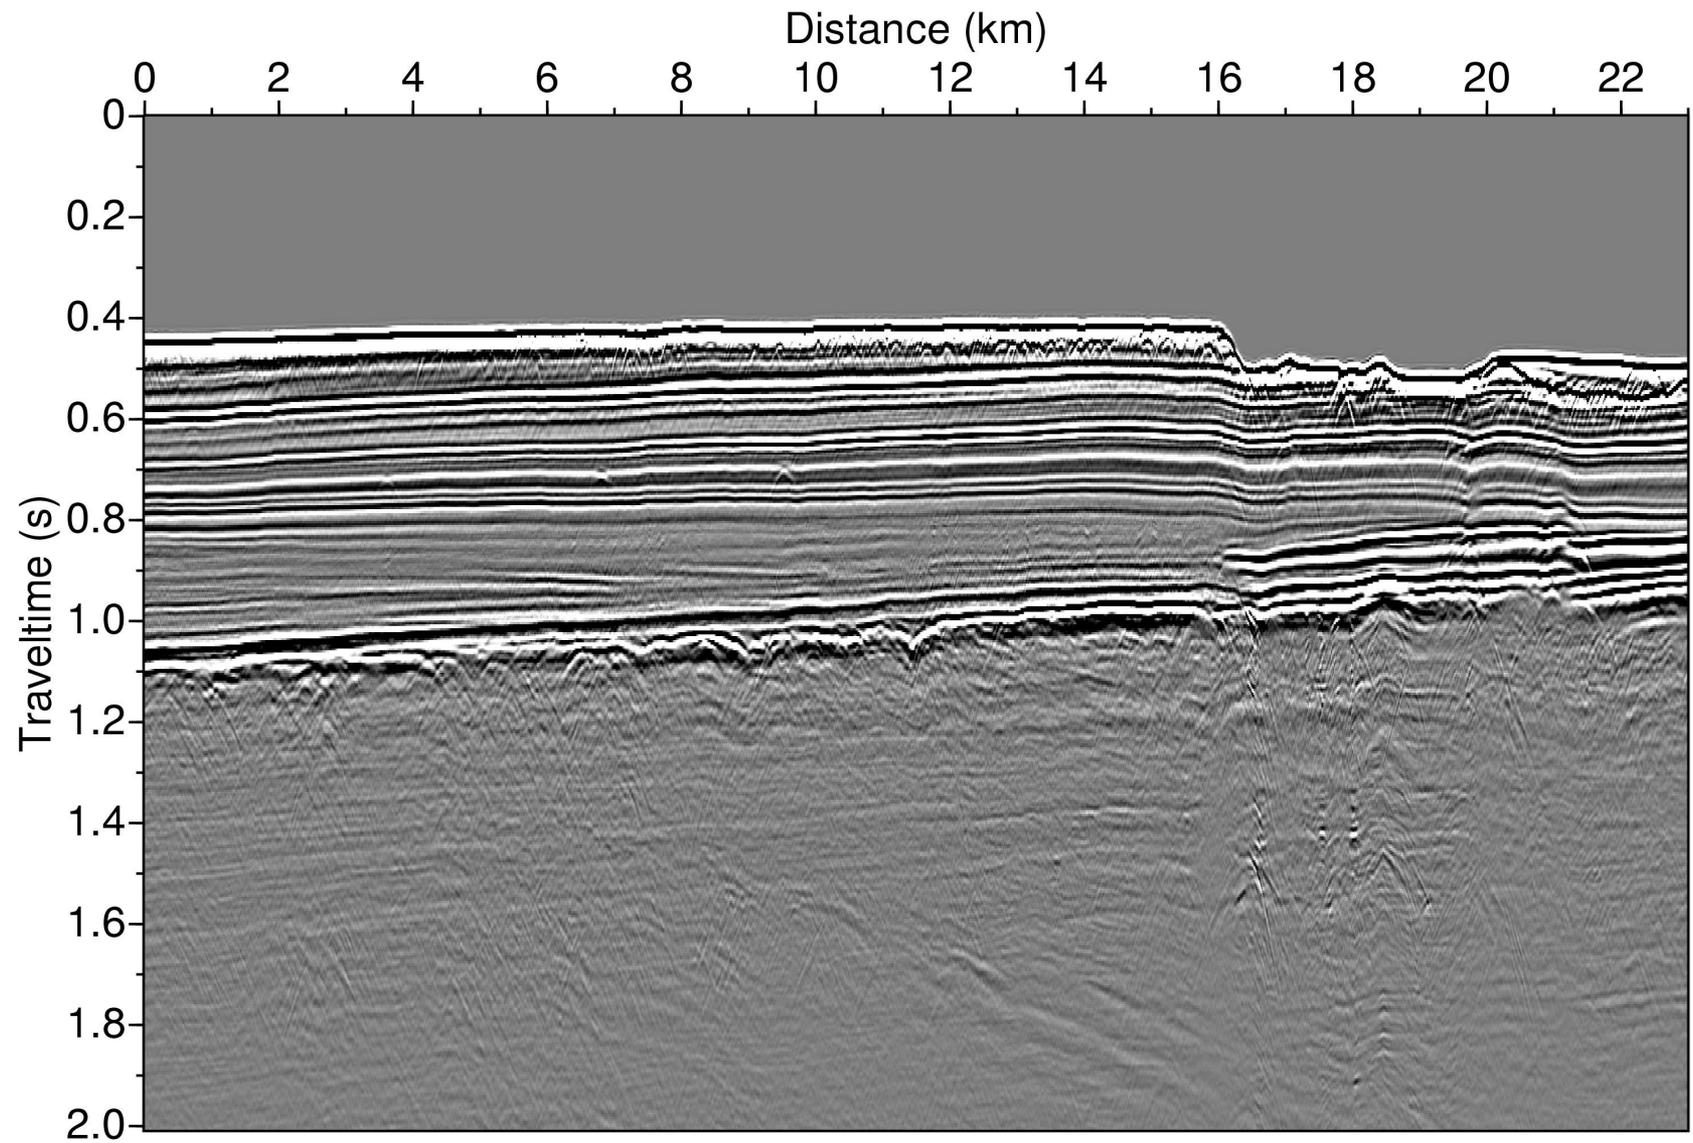

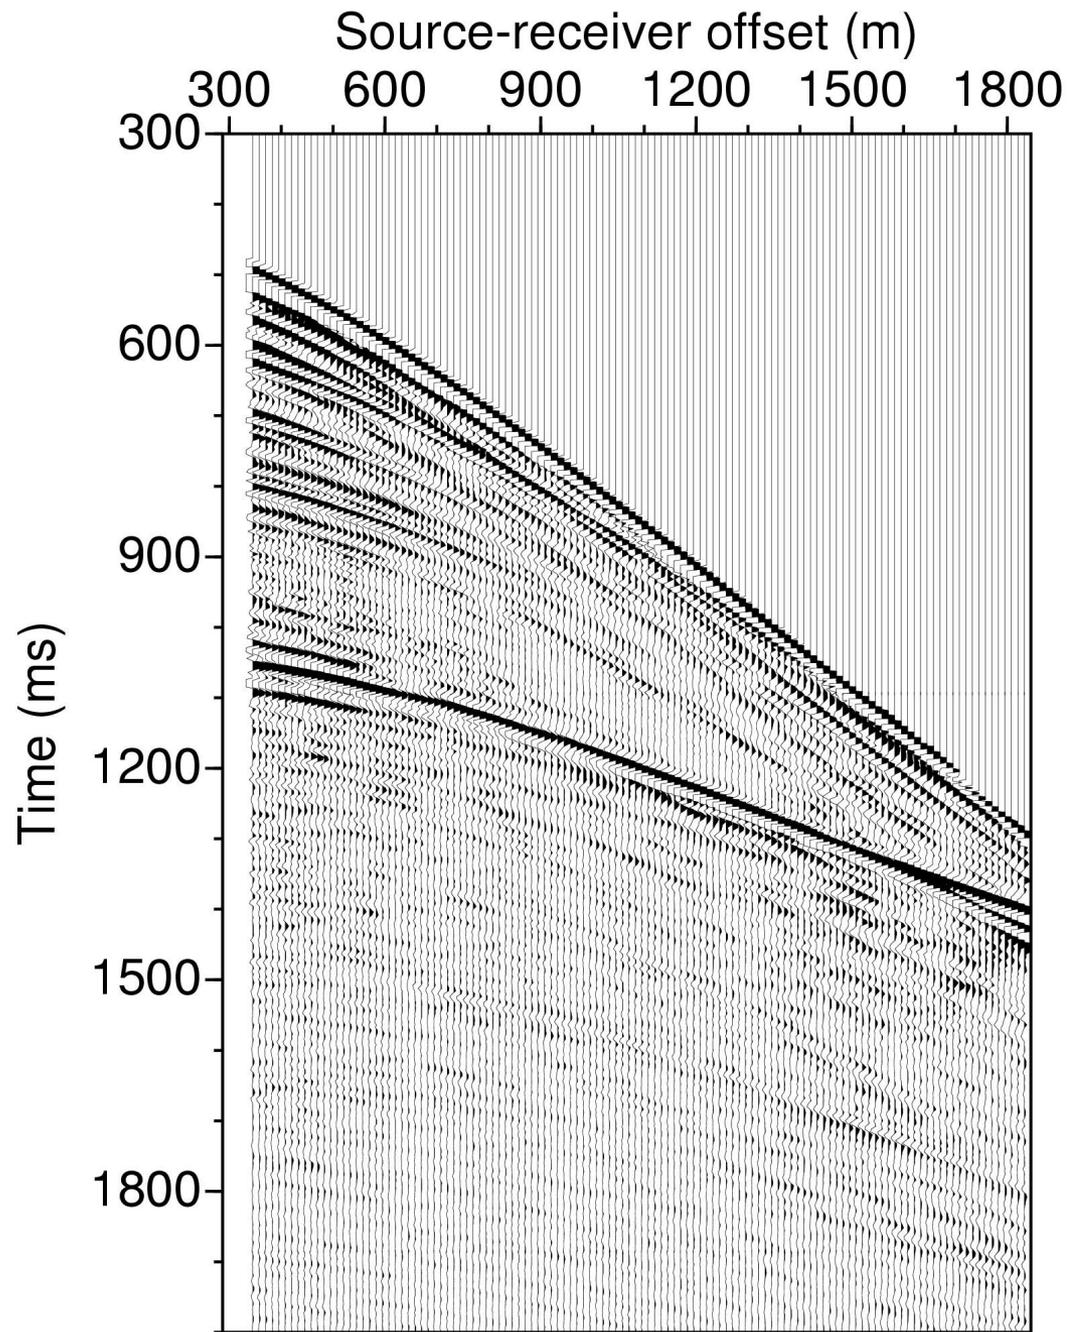

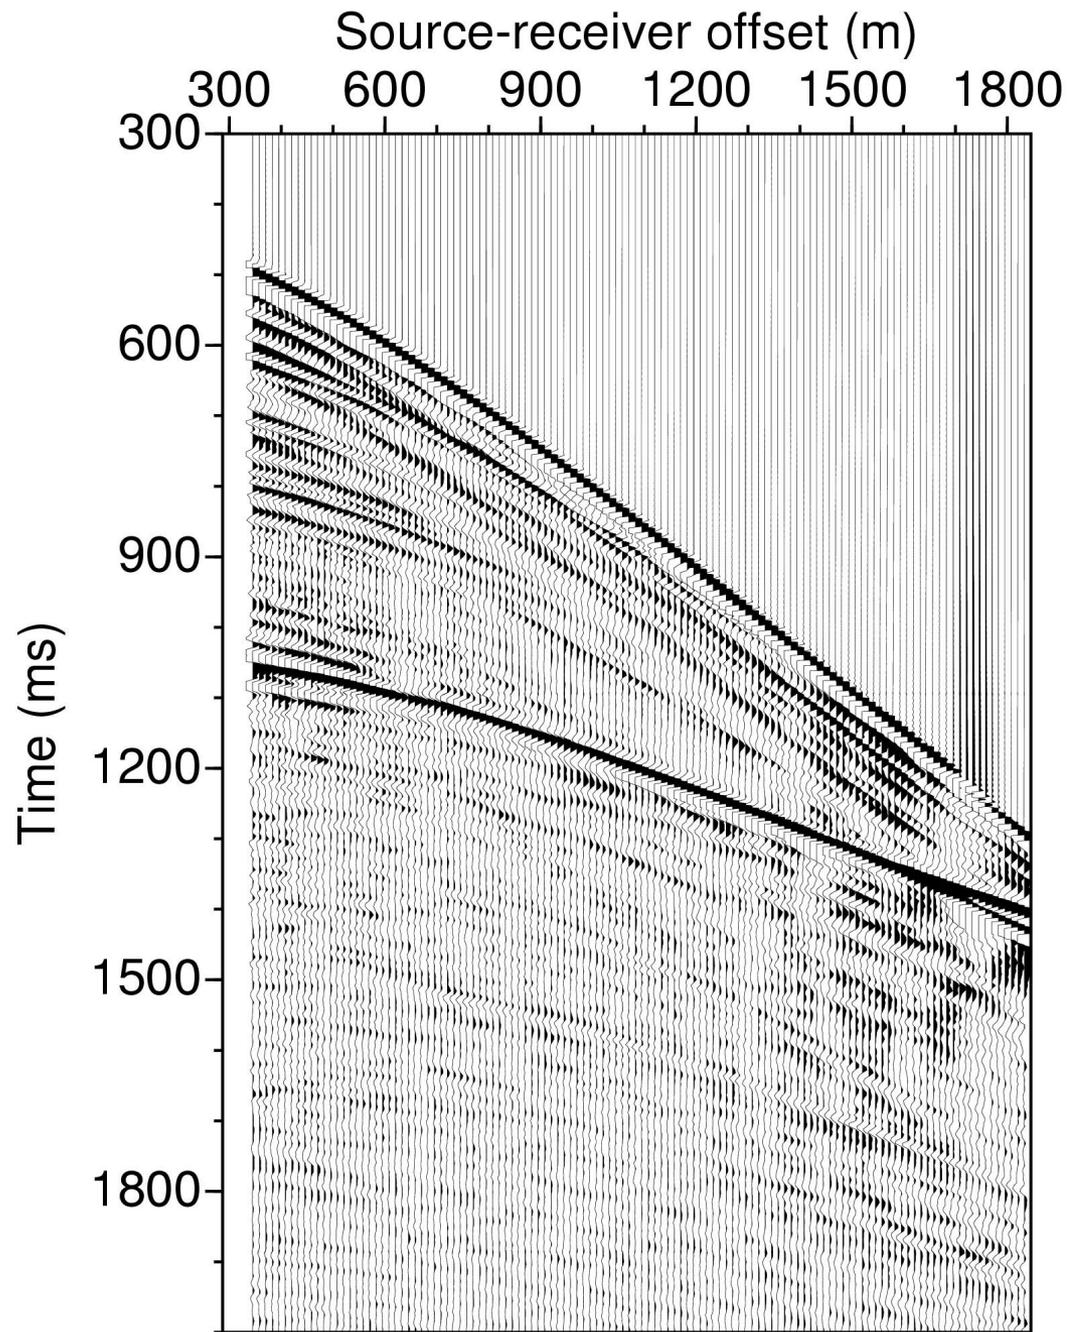

Multiple attenuation

2D

$$G_{2D}(\mathbf{r}, \mathbf{r}_s, \omega) = \left(\frac{-ic}{8\pi\omega R} \right)^{1/2} \exp\left(-i\omega \frac{R}{c} \right)$$

3D

$$G_{3D}(\mathbf{r}, \mathbf{r}_s, \omega) = \frac{1}{4\pi R} \exp\left(-i\omega \frac{R}{c} \right)$$

Partial compensation

$$W(\omega) = \sqrt{\frac{2\pi Rc}{i\omega}}$$

(frequency domain)

$$W(t) = D_{-1/2}(t) \sqrt{2\pi Rc}$$

(time domain)

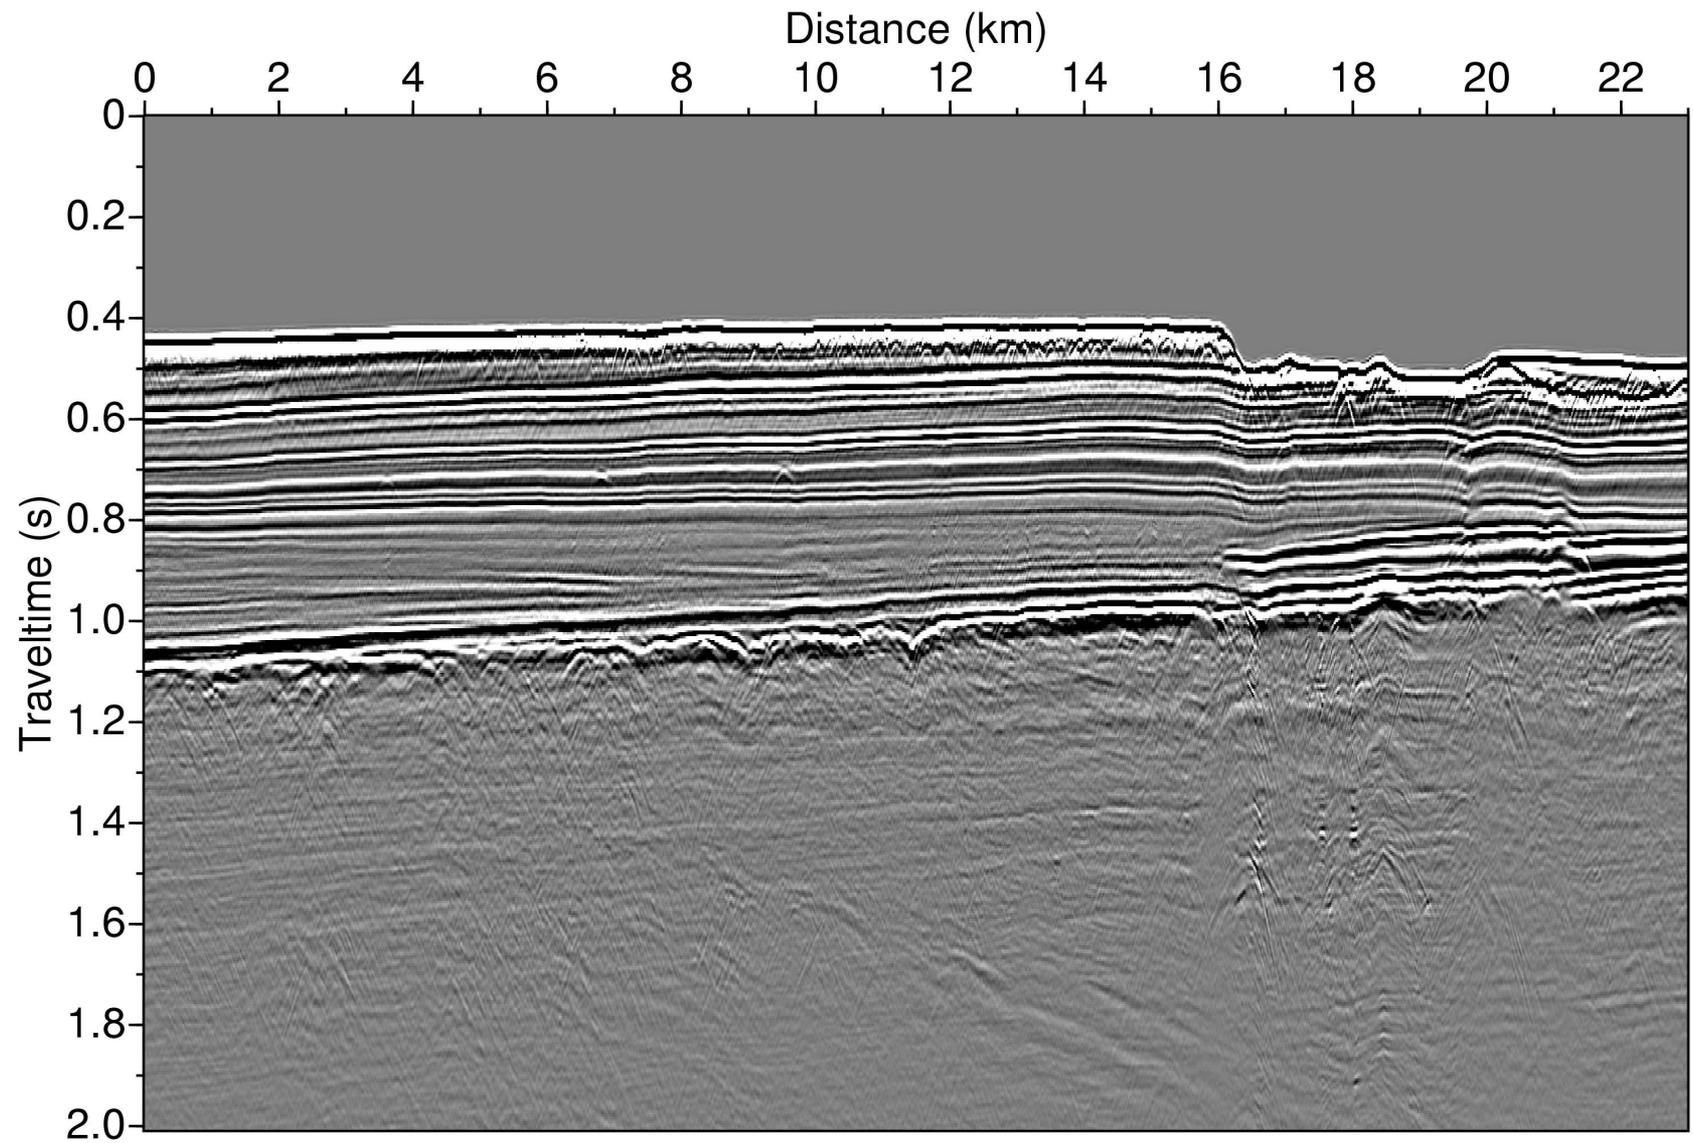

Partial compensation

$$W(t) \propto D_{-1/2}(t) c(t) \sqrt{t}$$

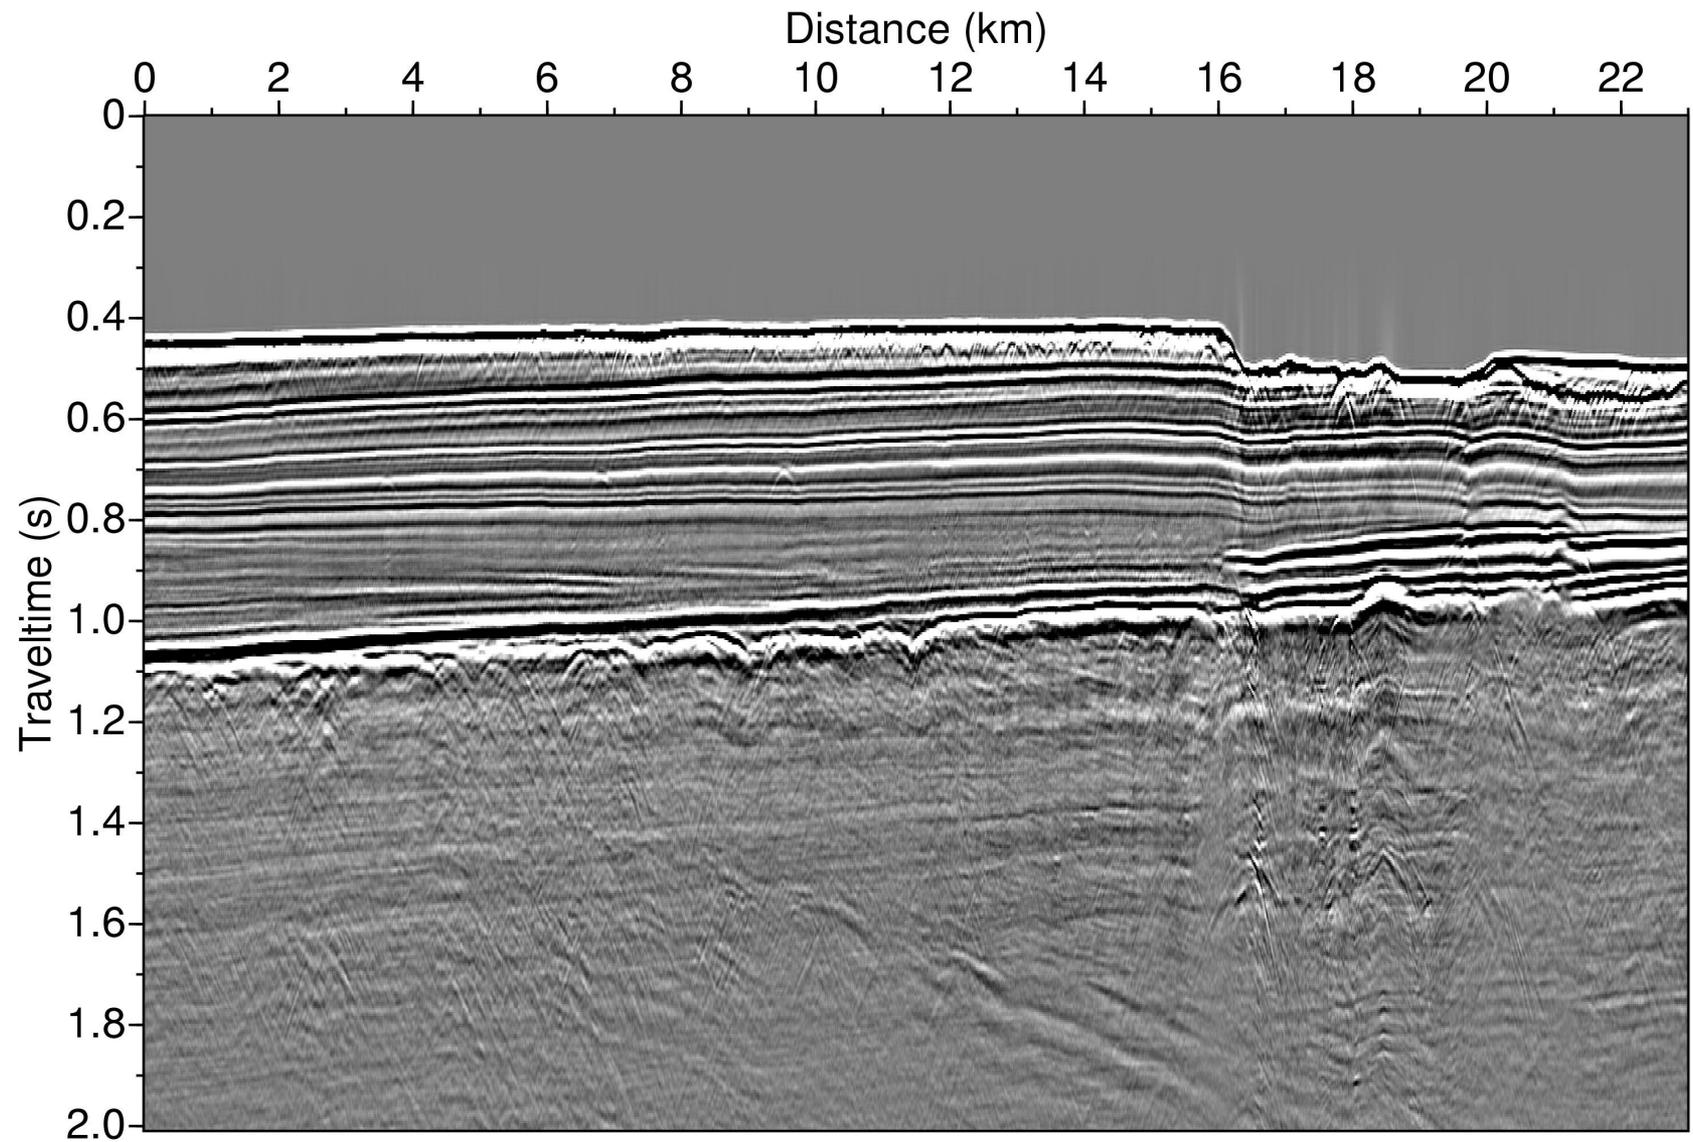

Implementation

Amplitude compensation in the time domain

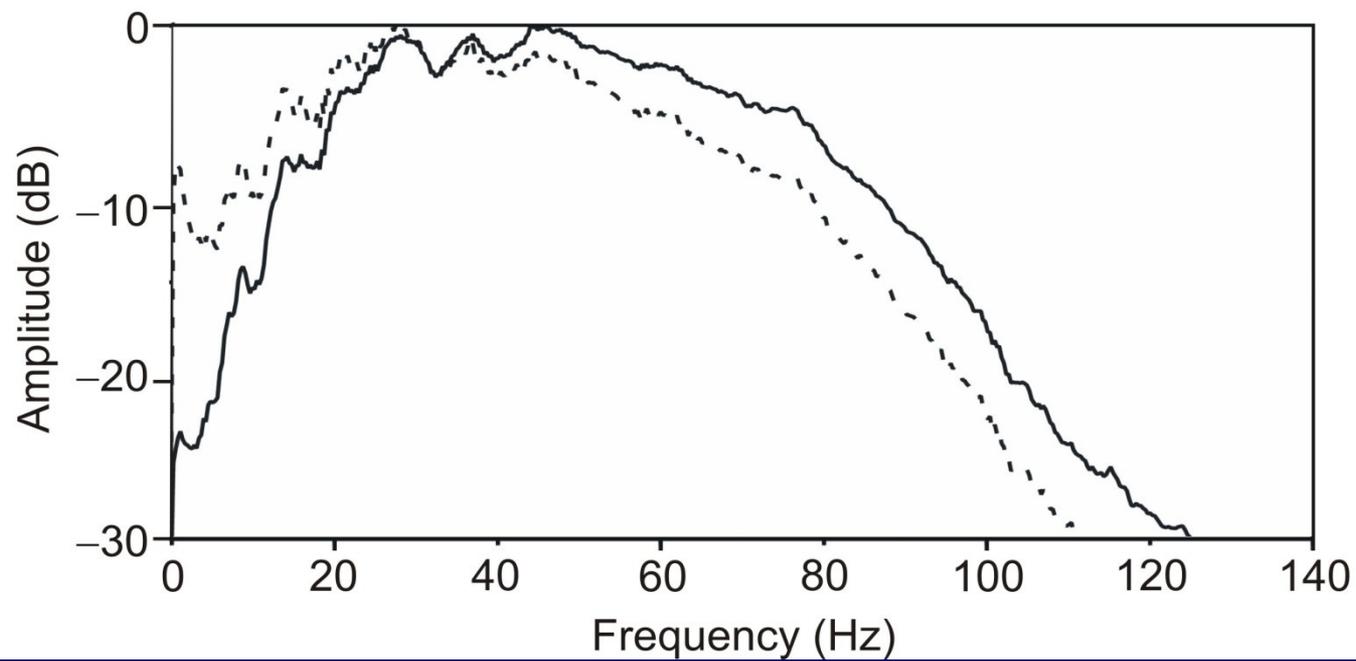

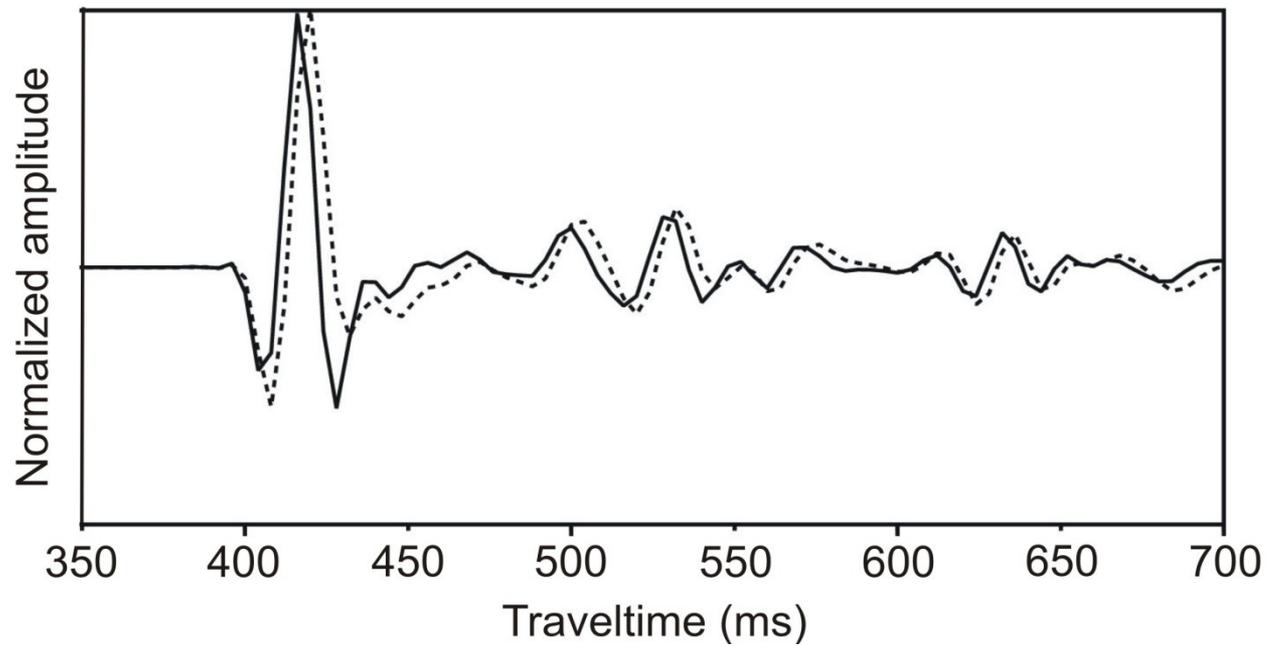

Phase correction in the frequency domain

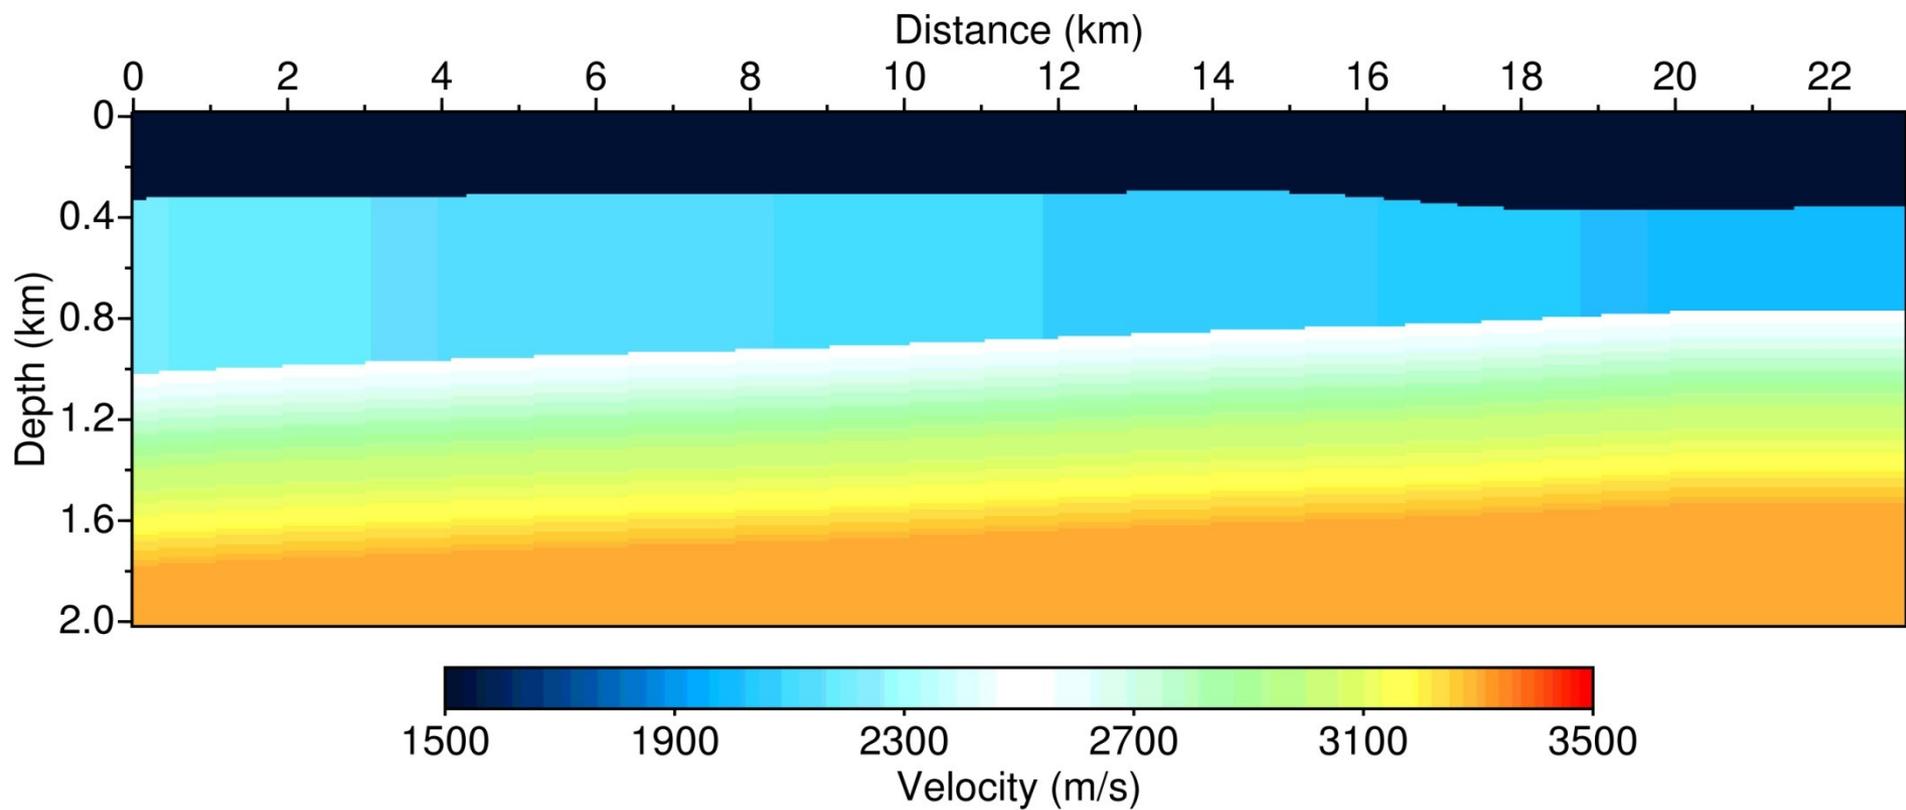

Multiple attenuation

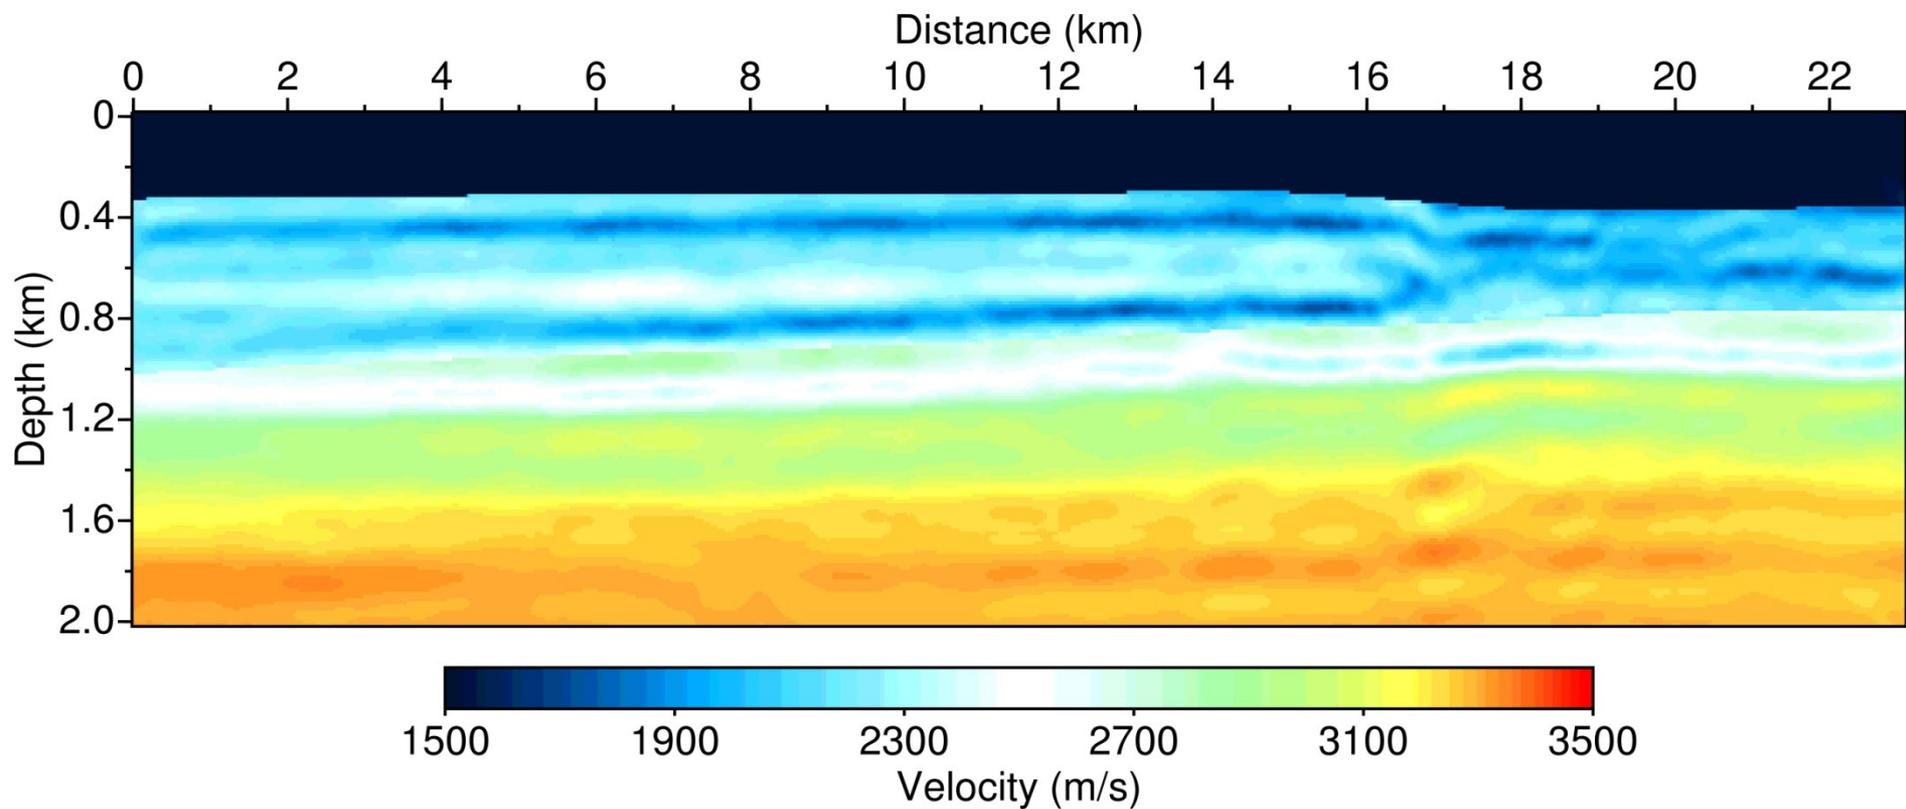

Amplitude and phase compensation

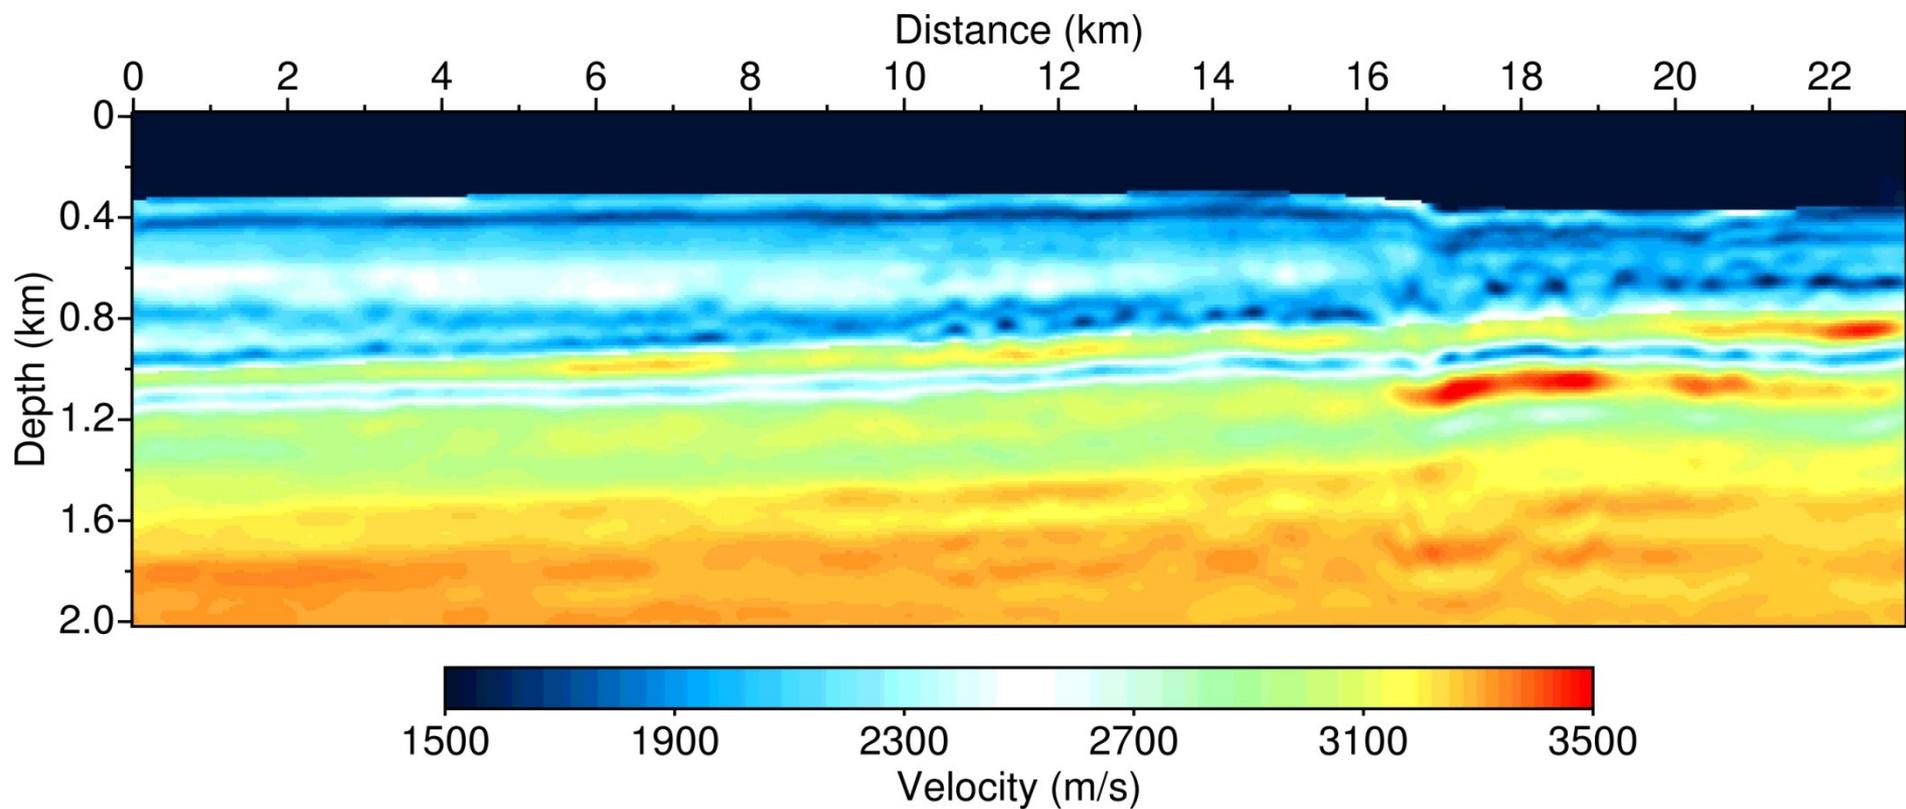

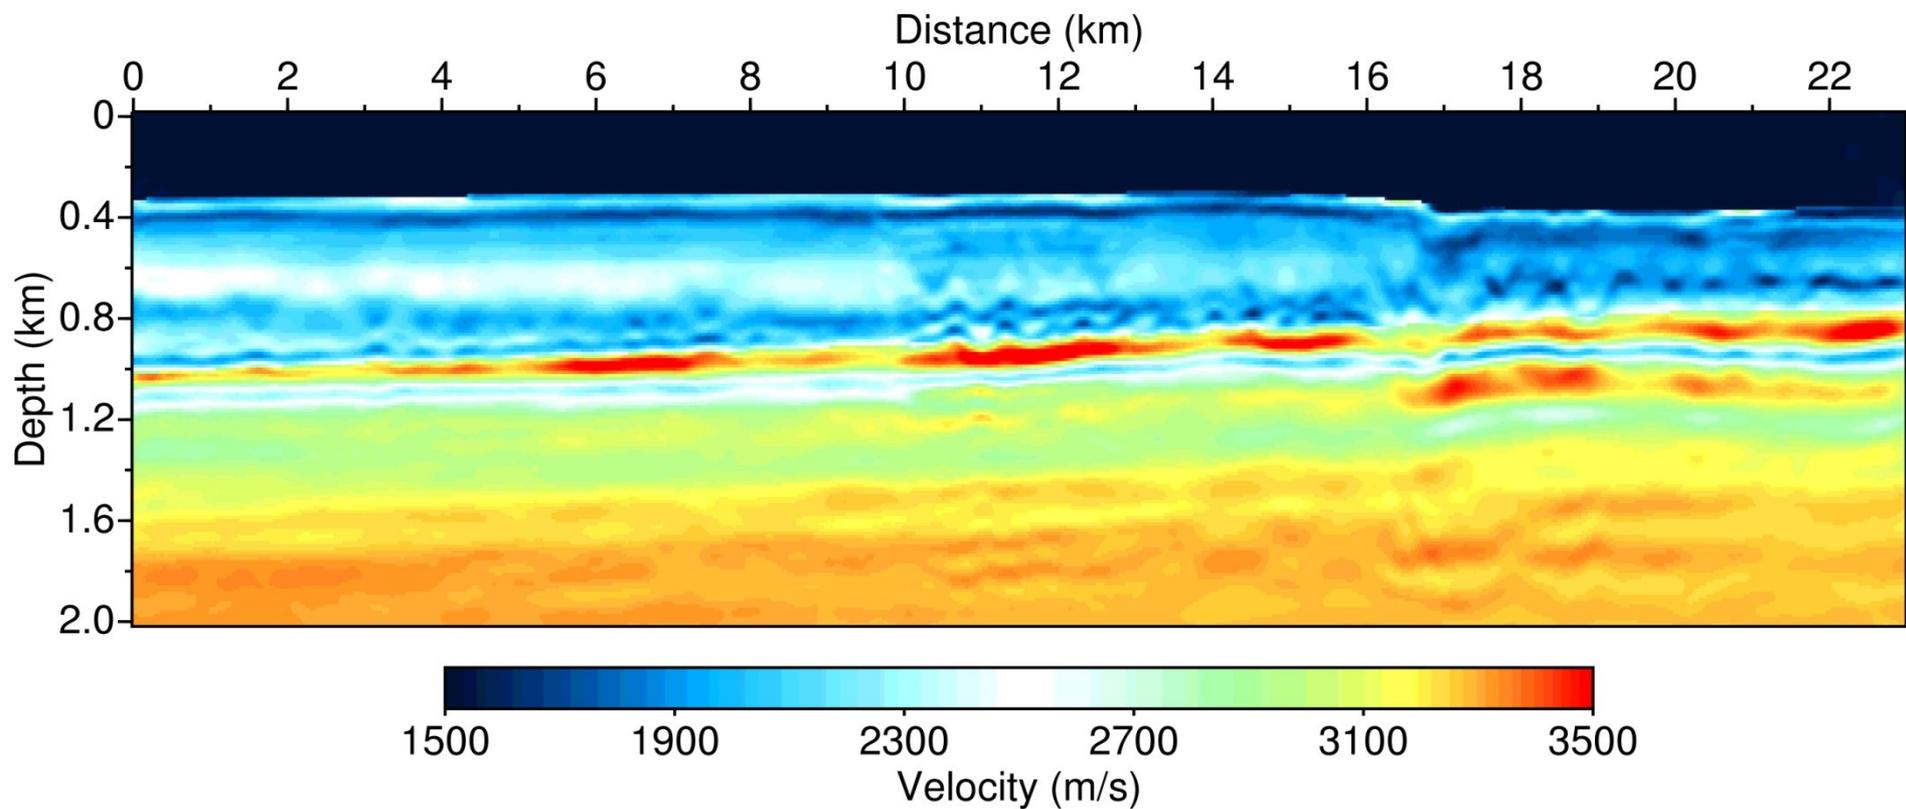

Traveltime tomography

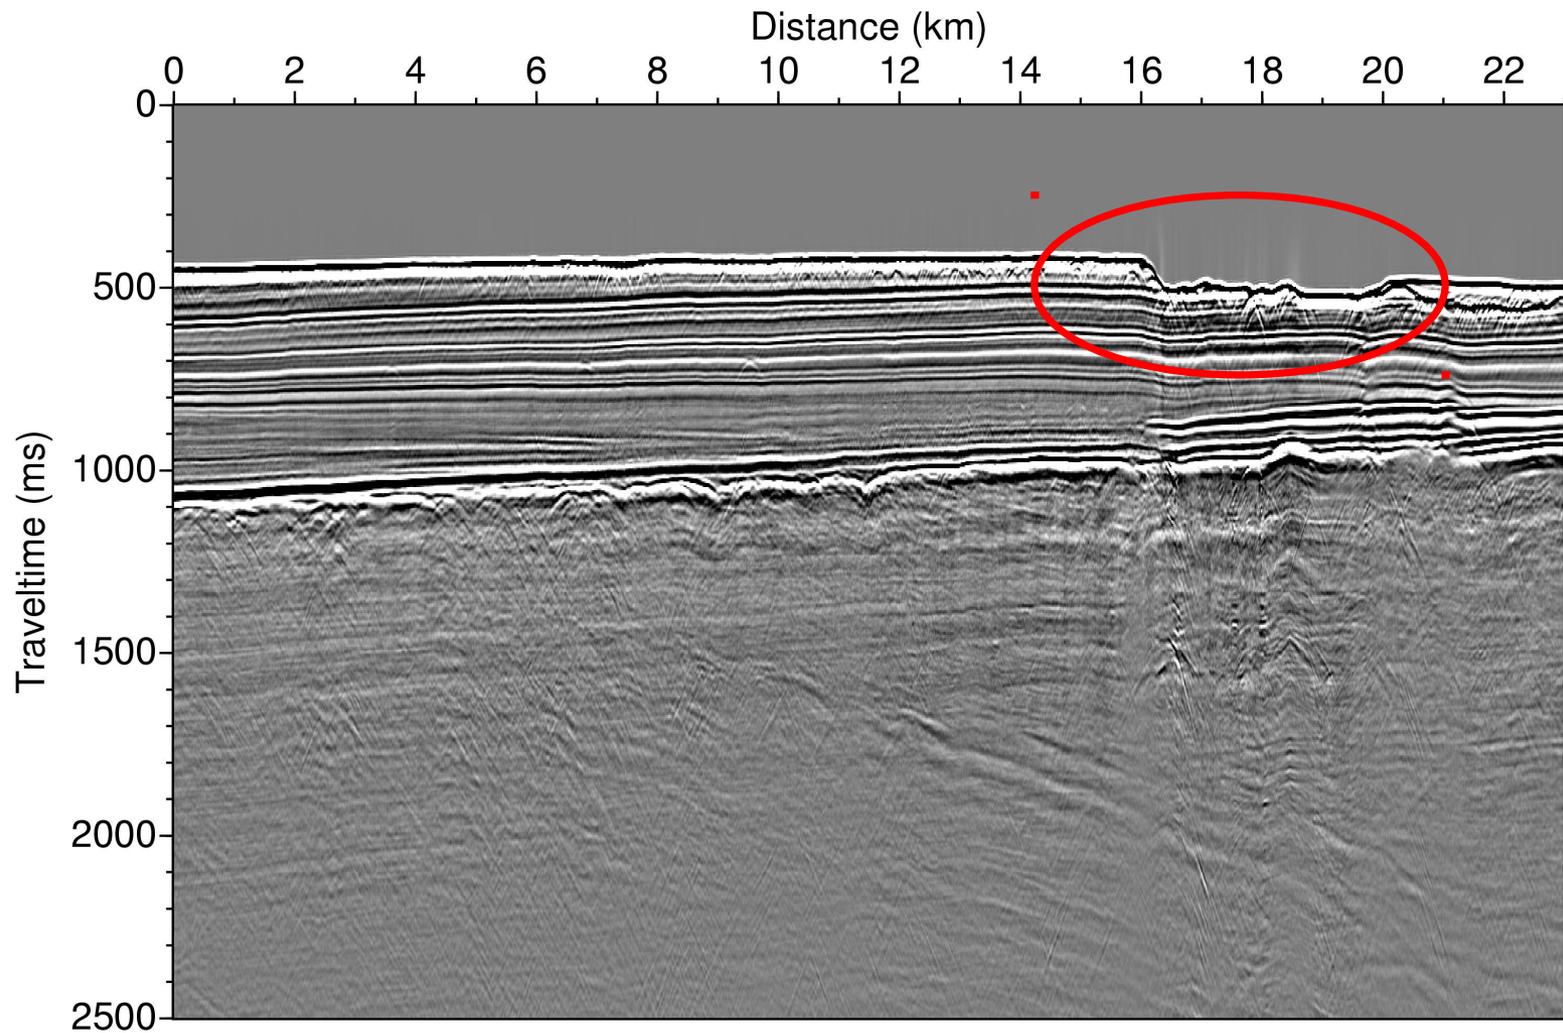

Tomography using frequencies of 6.9-7.5 Hz

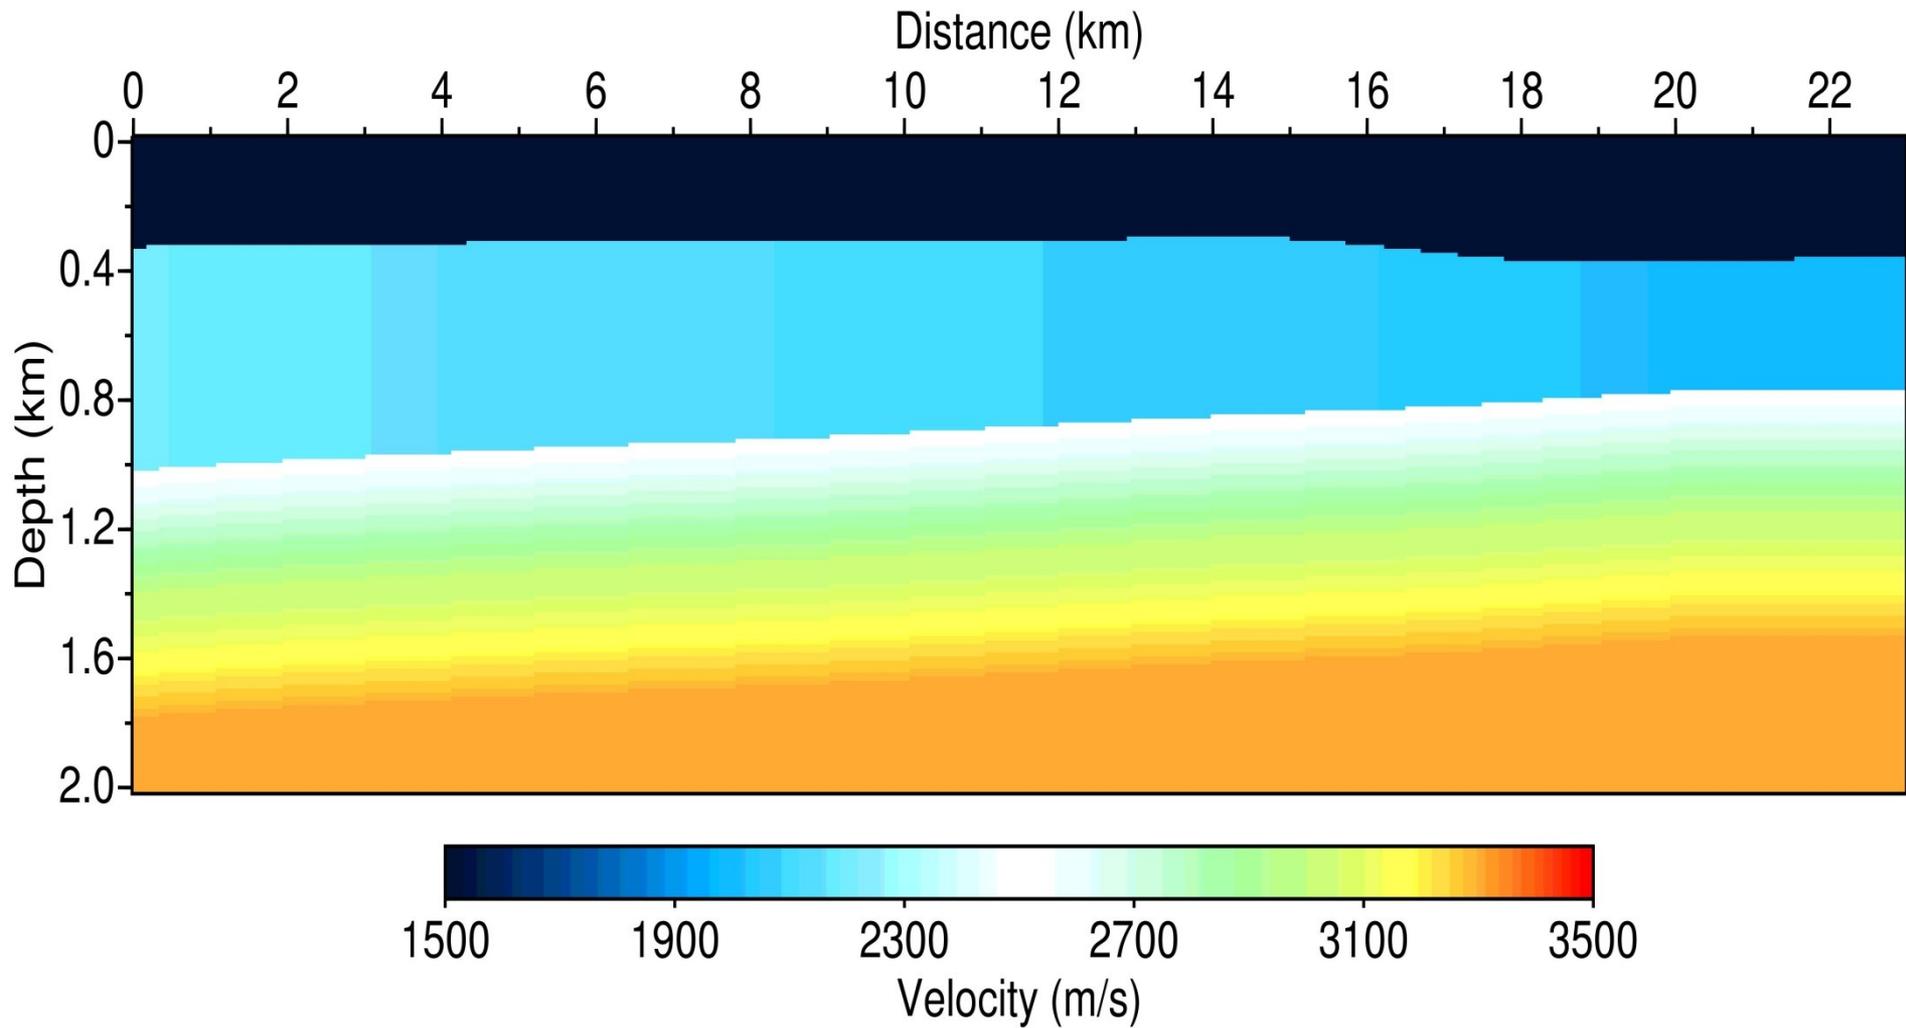

Tomography using frequencies of 6.9-13.8 Hz

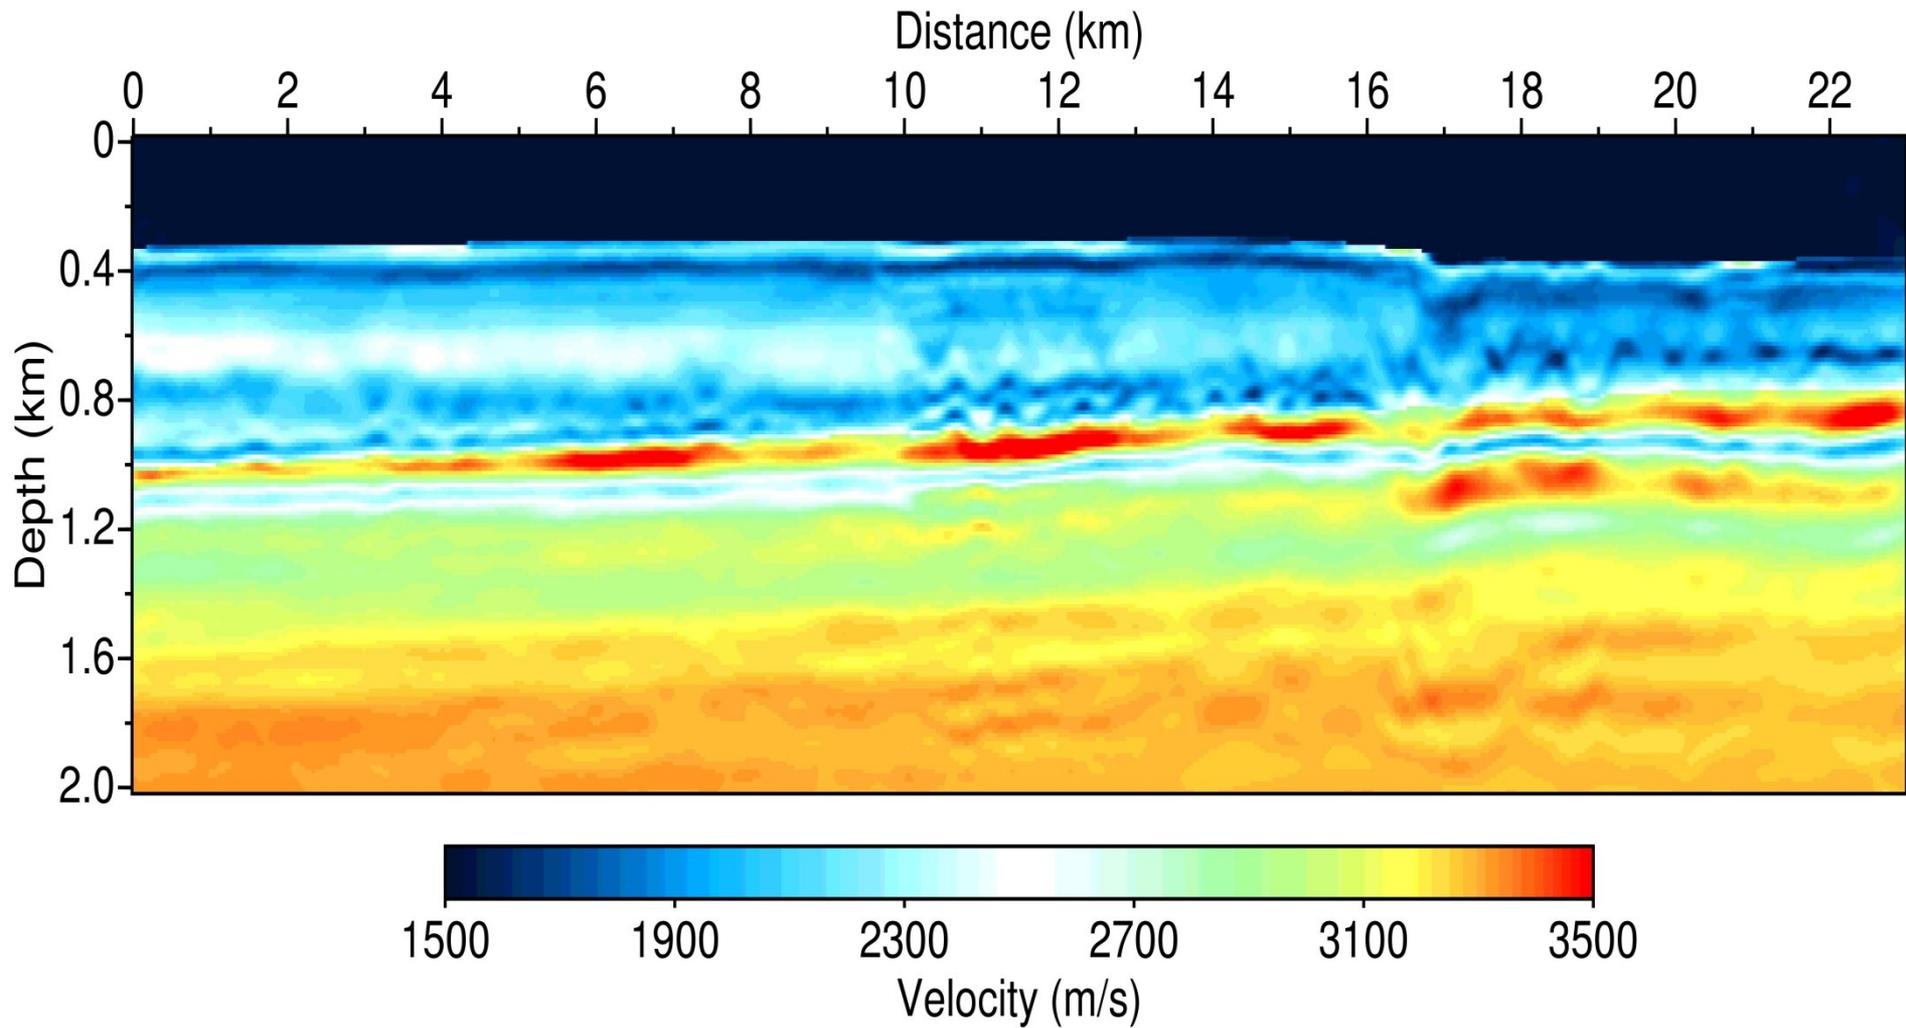

Tomography using frequencies of 6.9-30.0 Hz

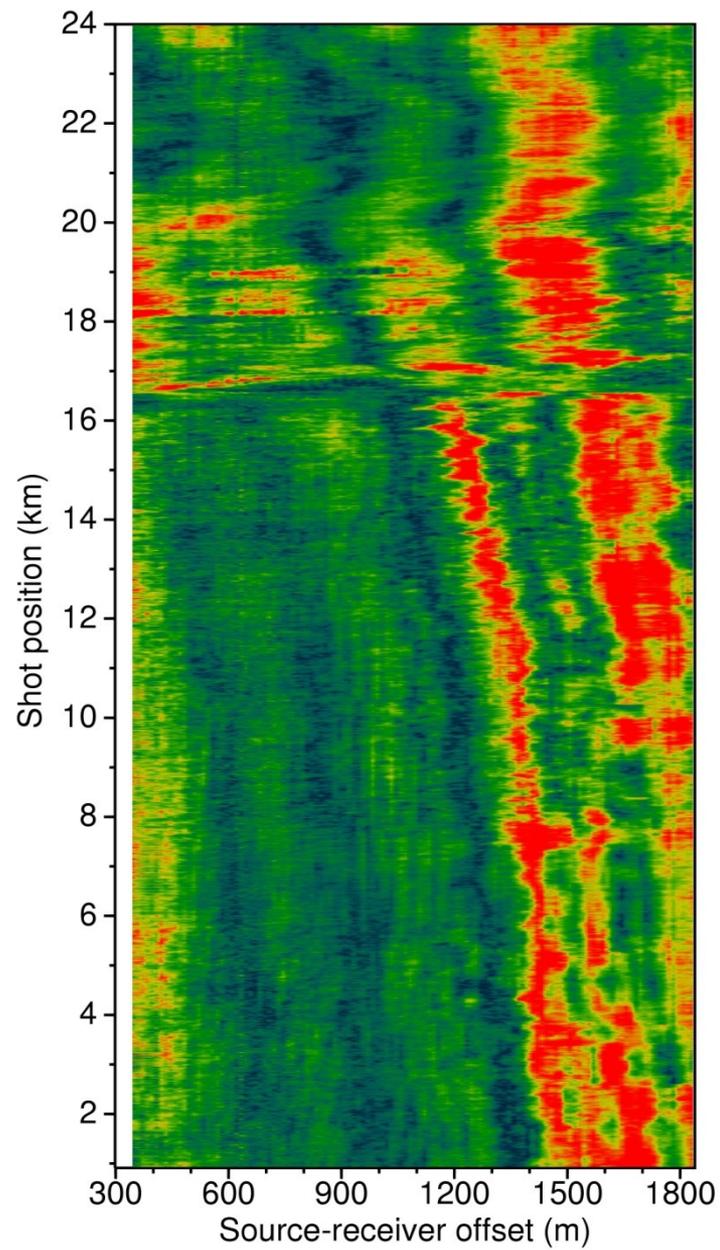

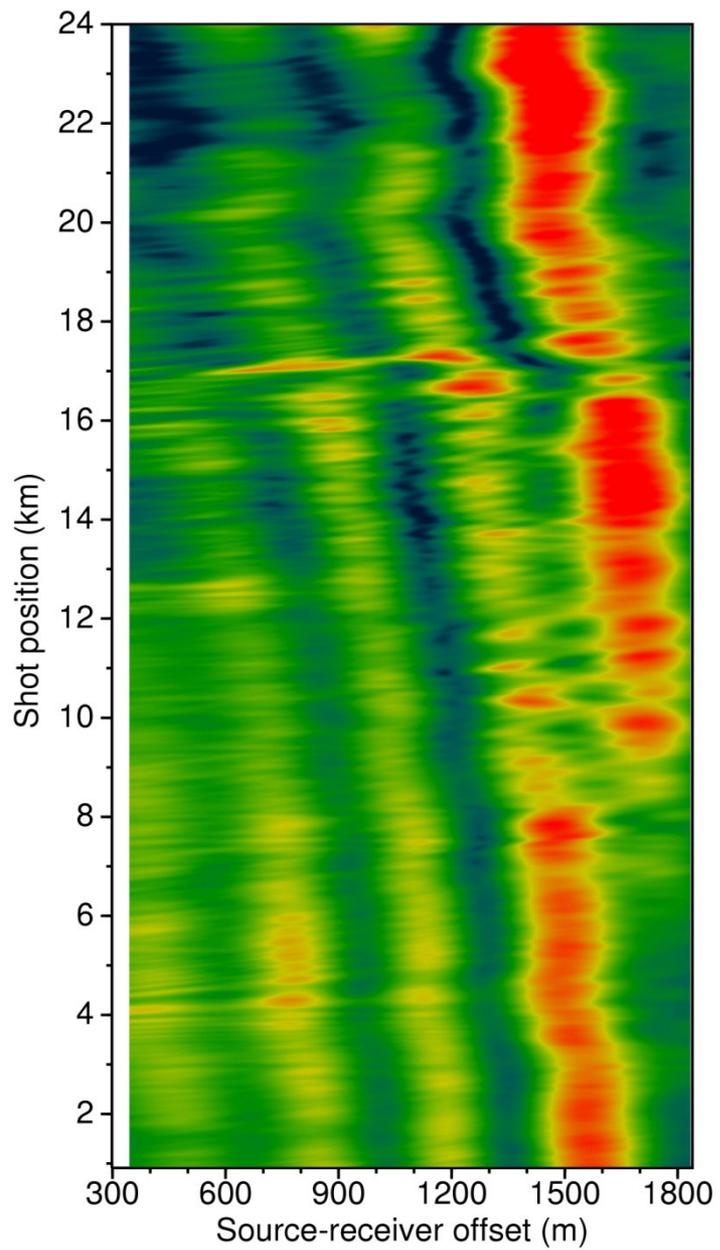

Stack section with amplitude and Phase compansation

Traveltime tomography

Waveform tomography

Key points

Weighted updating scheme for inversion

Pre-stack multiple attenuation

Partial compensation of 3D to 2D

Applicable to the exploration seismic data
