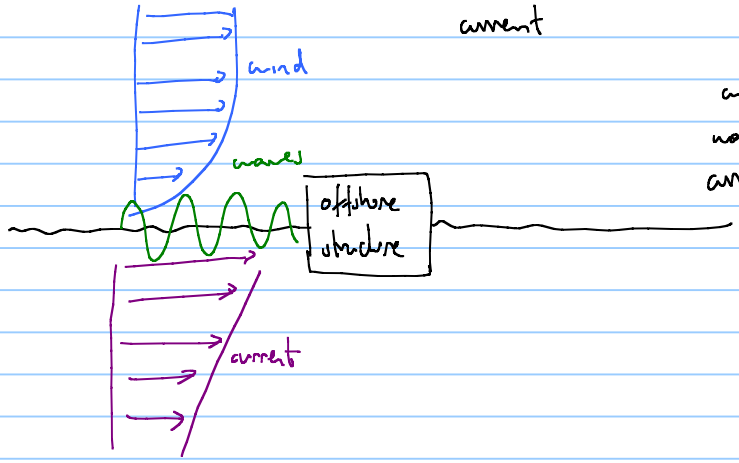
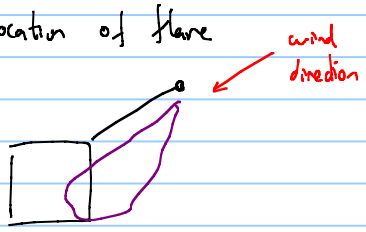
Offshore structures for oil and gas production

- effect of oceanographic environment: wind
  waves
  current

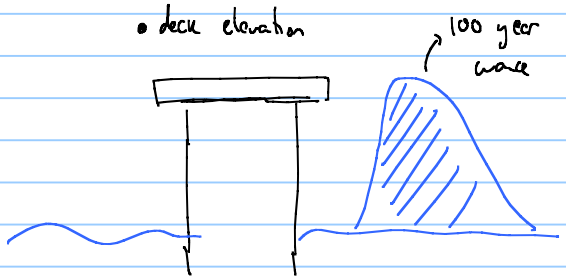


wind, waves, current must be taken into account when designing the offshore structure

- location of flare



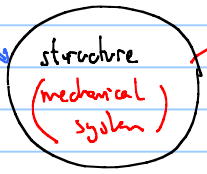
- deck elevation



- design wave, for a range of periods is most likely in the area
- storm (100 year storm)
- long term variations ~ fatigue

forces and wave loads on structure (t)

- magnitude
- frequency
- direction



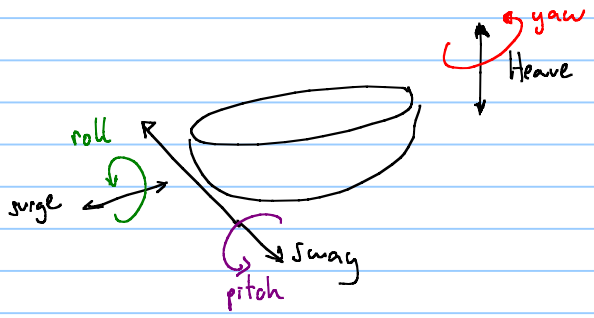
→ movement (t)
stress (t) → maximum stress
fatigue design

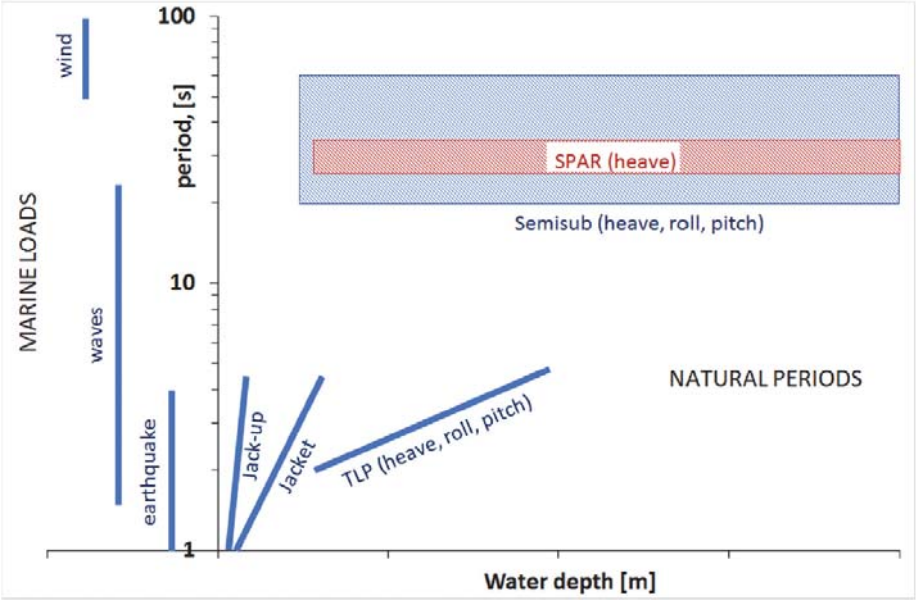
each structure, depending on it characteristics (mass, flexibility, dampening)

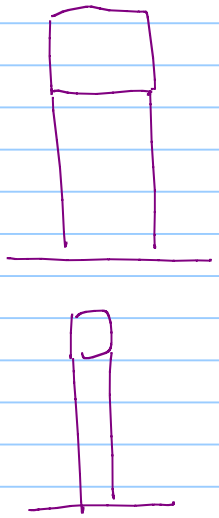
will have a natural frequency that if excited at this frequency might exhibit maximum movement and stress.

fixed structure

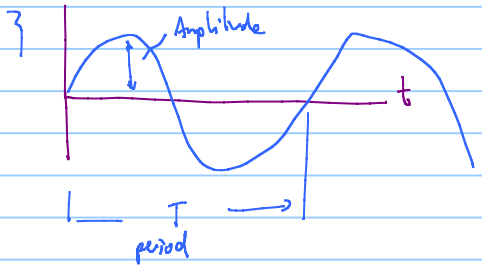
floating structure





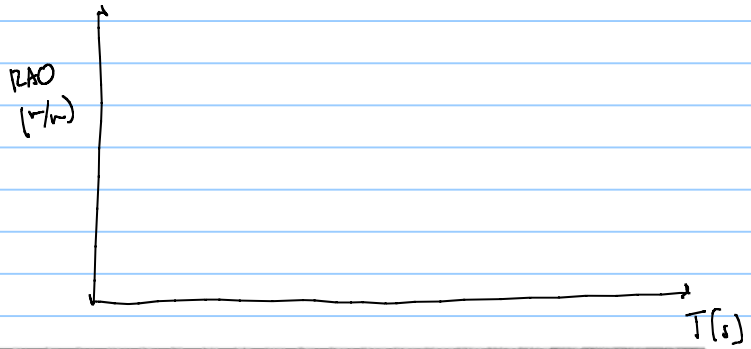


Response amplitude operator (RAO) = $\frac{\text{amplitude of response}}{\text{amplitude of excitation}} = \frac{\text{Heave [m]}}{\text{wave amplitude [m]}}$



$f = \frac{1}{T}$ $\frac{\text{cycle}}{s}$

RAO = 2



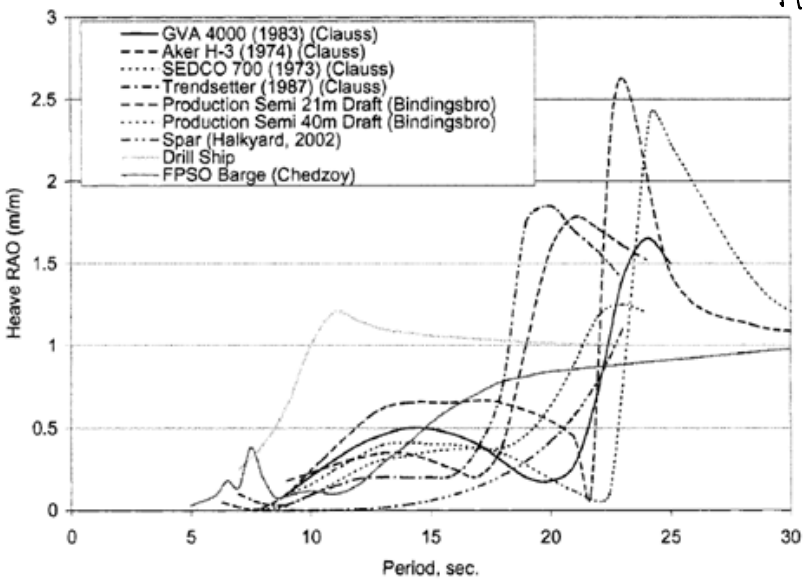


Figure 7.3 Example heave RAOs of various floaters

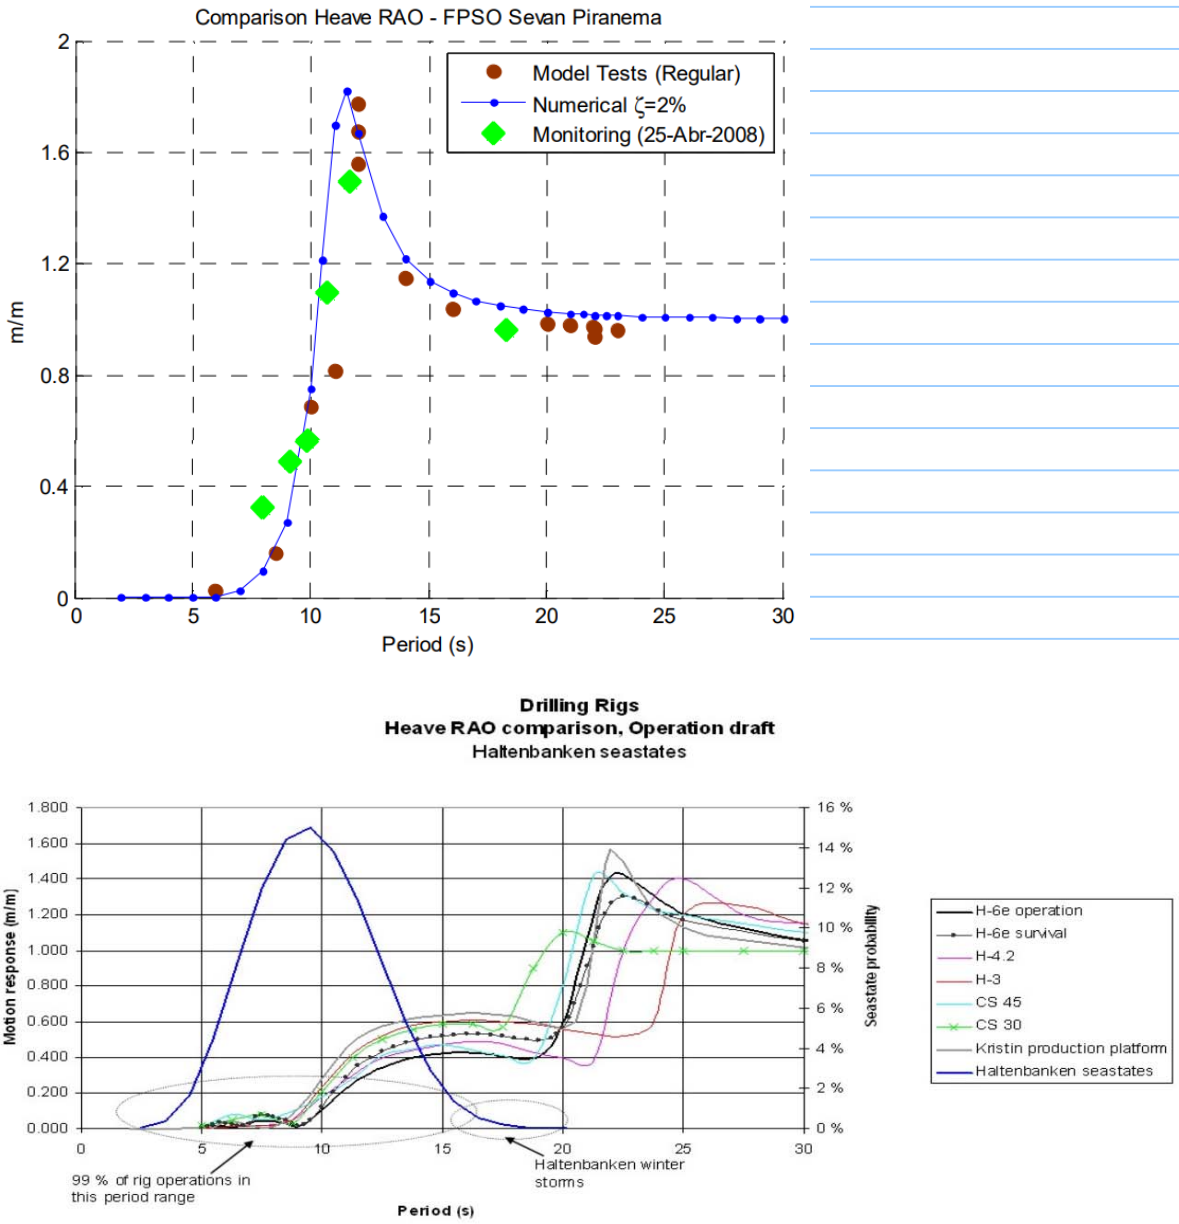

Figure 16.2: *RAO published on the AKER Drilling website.*

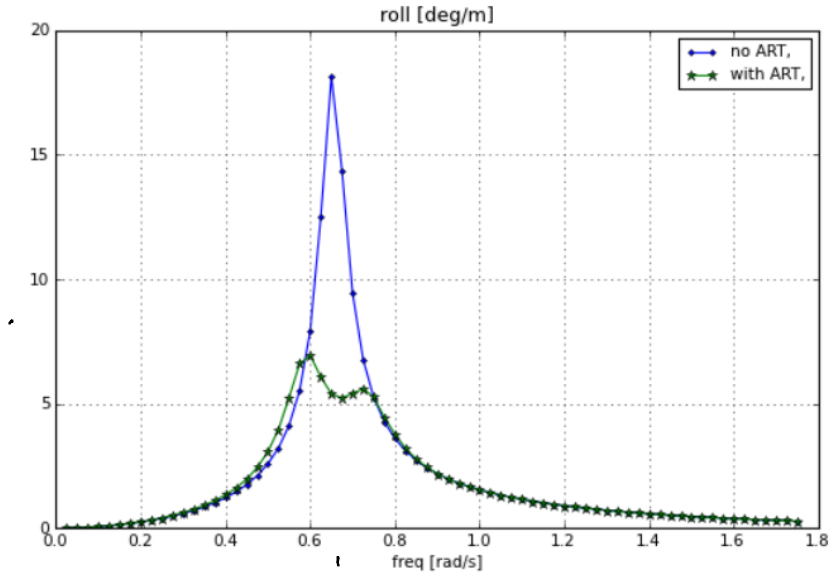

Figure 1: Typical RAO of roll of a ship with and without ART.

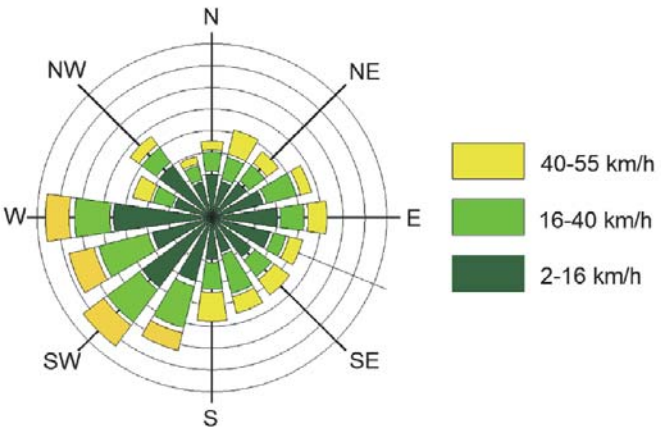
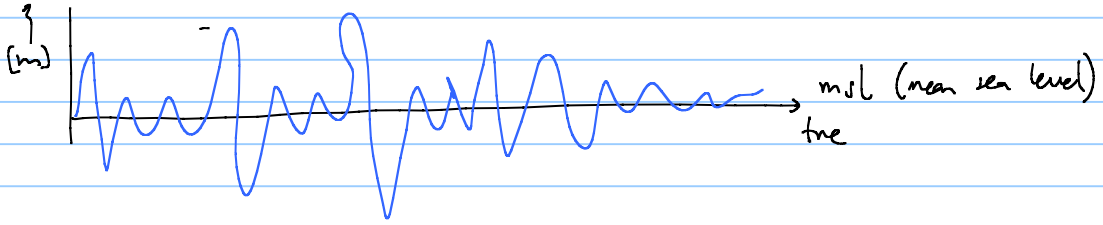
Wind



wind rose

wind and current are typically assumed constant and using the maximum value. (wind direction also must be taken into account)

Waves



Fourier

$$f(t) = \sum_{i=1}^{N} A_i \sin(\omega_i t + \phi_i)$$

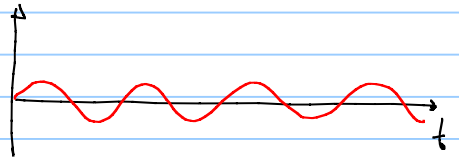
ϕ_i ~ phase shift

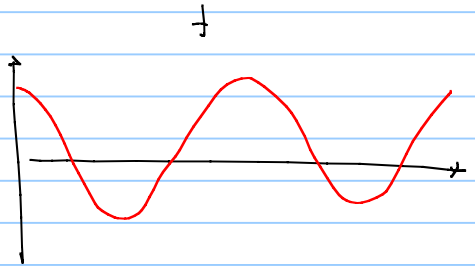
A_i ~ amplitude (m)

angular frequency $\omega_i = 2\pi f_i$

$\omega_i = \frac{rad}{s}$

$\left[\frac{cycle}{s}\right]\left[\frac{2\pi\ rad}{1\ cycle}\right]$

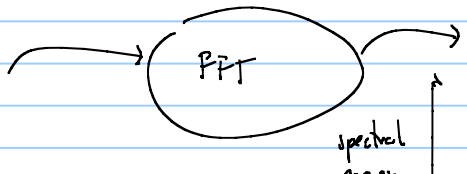




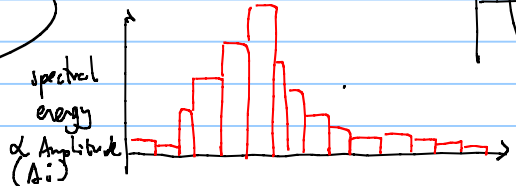
Discrete Fourier transform

FFT Fast fourier transform

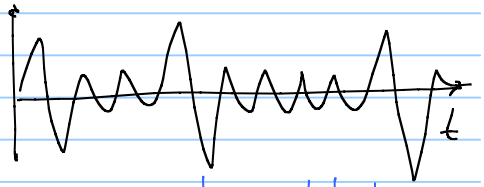
t	value
0	0
1	0
1	1
1	1



spectral peak period
dominant frequency

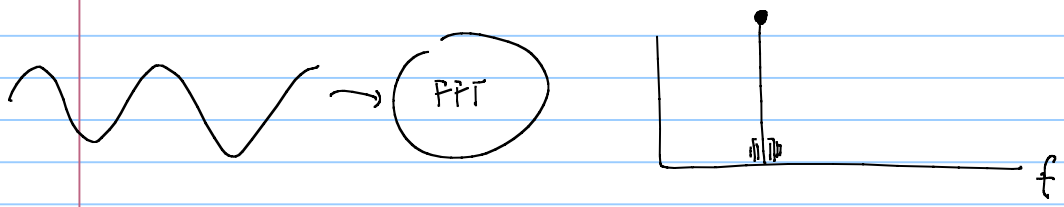


=



sometimes analytical equations are used

Pierson Moskowitz, JONSWAP



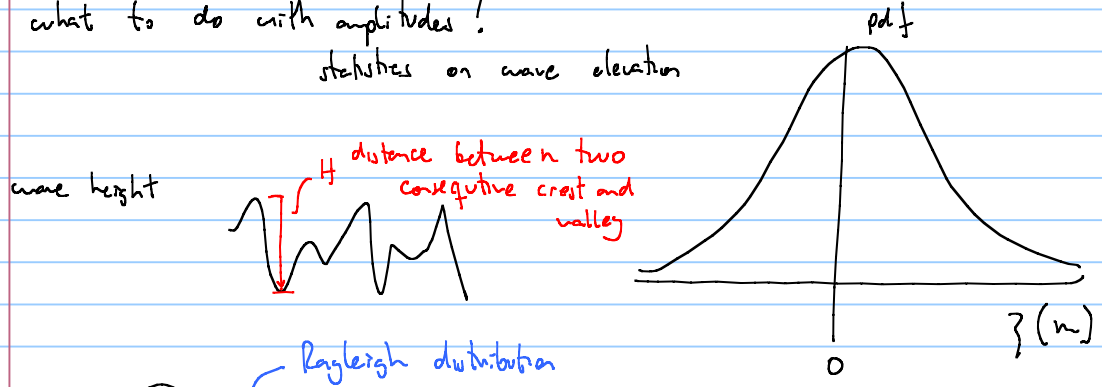
to deal with the variability of waves in time, we apply FFT on the signal and report spectral peak period

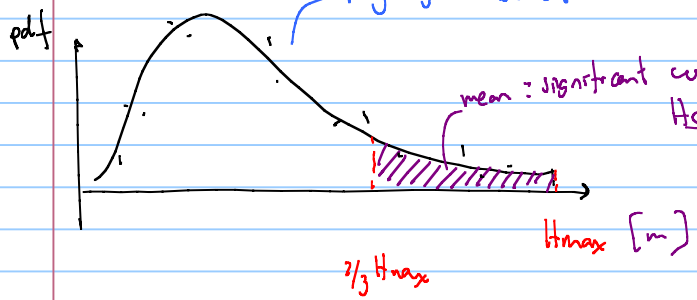
the spectral peak period does not change significantly in 3 hours

sea state

what to do with amplitudes?

statistics on wave elevation



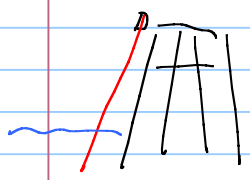


to characterize a sea state (3 hrs) Hs and Tp are used

wave Data must be gathered for at least 2 years to obtain a representative sample of wave conditions in the area

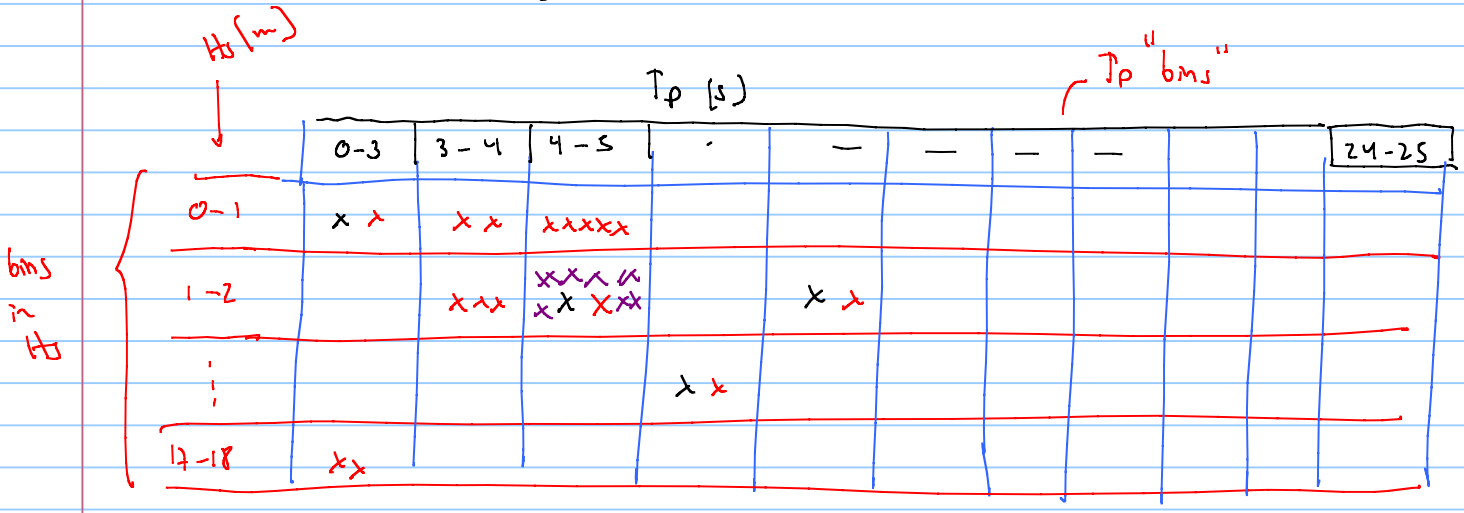
How many sea states are in 2 years

$$2\,\text{years} \cdot \frac{365\,\text{day}}{\text{year}} \cdot \frac{24\,\text{hrs}}{1\,\text{day}} \cdot \frac{1\,\text{sea state}}{3\,\text{hr}} = 5840$$



with all measured data, compute Tp, Hs for all

Scatter diagram of long term wave statistics



classify each data point I have in each box

	Spectral Peak period (T_p) [s]
